

Know It Now: The Effects of Brief Mental Health Workshop on Secondary School Students

Tan Sin Yee, Phang Jin Xiang

Universiti Tunku Abdul Rahman

This research project is submitted in partial fulfilment of the requirements for the Bachelor of Social Science (Hons) Psychology, Faculty of Arts and Social Science, Universiti Tunku Abdul Rahman. Submitted on 25 March 2019.

### Acknowledgements

This project would not have reached its present form without the valuable contributions of various people in so many ways. There are tons of guidance and assistance has been received from many people throughout the duration of this project. We would like to express our gratitude to various people who have been given their supports, assistances, and guidance.

First and foremost, we would like to express our deepest gratitude to our beloved Final Year Project supervisor, Mr. Tay Kok Wai. He always gave us constant encouragement, advisory, guidance, patience, and dedication throughout this project, despite his busy agenda. His generosity and being patient to help his students to overcome difficulties by providing guidance and coaching is mainly responsible for completing our project. His timely advice, scholarly advice, and meticulously check through our works have been greatly appreciated and his contributions have helped us to a large extend to accomplish this project.

Secondly, we would like to express our sincere gratitude to our parents for their emotional support as well as supporting us in financial throughout the duration of our bachelor degree and completion of this project. Our parents have always shown their unconditioned support to us and helped us overcome the difficulties without complaining.

We take this opportunity to express our sincere thanks to all the course mates who always given us valuable suggestions and keen to answer our questions pertaining to this Final Year Project.

We sincerely express our deep sense of appreciation to each and every one of you. May God bless each and every one of you in your future endeavours.

Declaration

We hereby declare that the report entitled “Know It Now: The Effects of Brief Mental Health Workshop on Secondary School Students” submitted is written by us and is our own effort and that no part has been plagiarized without citations.

Supervisor

Mr. Tay Kok Wai

## Abstract

The prevalence of mental health issues among the secondary school students is increasing. Past studies illustrated that one in five adolescents is living with mental health issue. There are numerous findings highlighted the urgent need of delivery mental health related information to this target group to cultivate prevention or encouragement of early intervention. This research aimed to examine the effectiveness of brief mental health workshop on mental health literacy in the areas of mental health knowledge, mental illness stigma, and health seeking behaviour from mental health professionals among the secondary school students in Malaysia. This research was conducted by using quasi-experimental pretest posttest design on a brief mental health workshop among 94 students from an independence high school aged 16 to 19. Our findings indicated a significant increase in mental health knowledge ( $p < .001$ ) and a significant decrease in mental illness stigma ( $p < .001$ ), however, no significant difference was shown for help-seeking behaviour between the pretest and posttest. Males ( $M = 8.41, SD = 2.91$ ) and females ( $M = 6.78, SD = 2.76$ ) differ significantly in the pretest for mental illness stigma,  $t(92) = 2.75, p < .01$ . This study showed that a brief mental health workshop is viable to improve mental health knowledge and reduce mental illness stigma. This study provides evidence that a brief mental health workshop can elicit positive impacts in mental health literacy on Malaysian adolescents which born in a multiracial and multicultural context.

## Chapter 1 Introduction

### Background of Study

World Health Organization (WHO) (2017) described that depression and anxiety disorders are relatively high in prevalence, particularly depression being the prior cause of global disease burden and disability. WHO claimed that there were more than 300 million people suffer from depression in 2015, amounted a 4.4% of world's population, and the similar goes for anxiety disorders (WHO, 2017). In Malaysia context, by 2015 there were more than one million total cases reported on depressive disorders and almost one and a half million total cases reported on anxiety disorders, equivalent to 3.8% and 4.9% of the nation population respectively (WHO, 2017).

Besides, the National Health and Morbidity Survey (NHMS) was reported that the pervasiveness of mental health issues for Malaysians aged 16 and above by 2015 was around 30% of the population from only 10.7% in 1996 (NHMS, 2017), this group of people are required immediate attention or remedial actions (Ministry of Health Malaysia, 2016). Lee and Syaid (2017) mentioned that there an is issue concerning the increase in mental health issues among students and they added the core factor is pressure exerted by academic and environmental causes which can result in depression, anxiety, insomnia, suicidal ideation.

Studies show that approximately one out of five adolescents may live with mental health issue especially depression or anxiety in any particular year, and it has been discovered that adolescents with depression are more likely to have suicidal ideation (Ibrahim, Mohd Sidik, Phang, Mukhtar, Awang, Ang, Osman, & Ab Ghaffar, 2017; Burns & Rapee, 2006), and suicide is the second risk factor of death for youth who aged 15 to 29 years old (Ibrahim et al., 2017). Experiencing of mental illness in childhood or adolescence is the risk factor for several more serious mental illnesses in the later development (Copeland, Adair, Smetanin, Stiff, Briante, Colman, Fergusson, Horwood, Poulton, Costello, & Angold, 2013). According

to the findings reported by NHMS (2017) showed that prevalence of mental health problems among individuals in their adolescence in Malaysia was approximately 20% for depression, 40% for anxiety, and 10% for stress and boys showed a relatively higher 18.9% of prevalence compared to girls which were 17.7% for depression whereas girls amounted higher in anxiety and stress. Mental health issues among children trigger distress and may result in wide-ranging effects such as impacts on academic completion, interpersonal relationship, influencing life chances and physical health related issue (Goodman, Joyce, & Smith, 2011).

In terms of risk of depression, students hold a higher risk as compare to the general public because of stressful academic events and financial problems encountered while pursuing their tertiary study (Khan, Sulaiman, & Hassali, 2010). Because depression is common, treatable, and may begin early in life, thus, the best opportunity for prevention is among young people (Swartz, Musci, Beaudry, Heley, Miller, Alfes, Townsend, Thornicroft, & Wilcox, 2017). Burns and Rapee (2006) claimed that there is a pressing need to increase the young person's help seeking behaviour and the ability to determine who they should seek help from.

In terms of mental health literacy, a finding from Yeap and Low (2009) mentioned that the majority of their respondents from Malaysia did not have good knowledge of mental health. They also described that Malaysians are not well informed regarding the mental health services and having inadequate ability to acknowledge the need for seeking help from the right professionals such as psychiatrist and clinical psychologist. The previous study conducted by Loo, Wong, and Furnham (2012) showed that there was only a small number of Malaysian participants endorsed professional help as the majority was unable to recognize the problem as mental illness. Swartz et al. (2017) describe that health awareness programmes in institutions are an effective way in correcting young people's perspective about mental health

matters and improving intention for help-seeking, the ideas to educate to the children during programmes are potentially extensive in penetration to the community.

The increase in mental health problems and the elevation of prevalence and reporting of psychiatric cases in developing countries are a result of increased social changes, for instance, Malaysia has undergone robust economic growth in recent decades, in regard to this, mental illness stigma is one of the inevitable causes of increased social changes (Loo et al., 2012). Public stigma for mental illness such as depression is serious and presents in many countries, for instance, people usually hold negative attitudes toward people with depression, negatively view about their personalities, and even refuse to have contact with them, and this phenomenon appeared to be severe in Japan (Han & Chen, 2014). The more people think mental health issue is stem from insufficient willpower and weak cognitive functioning, the more unwillingness they will in building a close relationship with people with a mental health issue in their daily lives (Han & Chen, 2014).

Han and Chen (2014) described that by referring to Weiner's attribution theory, those who suffer from stigma encounter more negative emotional and behavioural reactions from other individuals when they view to see their problems as their own responsibility. Educate the causes of mental illness with biological and genetic attribution, for instance, convey the fact that major depression are biologically based brain diseases can reduce the people's psychological blameworthy attitudes and desire for social distance towards individuals with depression (Han & Chen, 2014), as well as improve help-seeking behaviours and treatment compliance (Tay, Tay, & Klainin-Yobas, 2018).

Although Malaysia has done significant improvement in its mental care system and policies (Deva, 2004), however, there is still insufficient public awareness on mental health issue and the possible reasons might be the adherence to traditional cultural belief and practices, particularly the publics from rural areas, moreover, it may also happen because of

the shortage in accessibility of mental health services and insufficient mental health professionals (Loo et al., 2012).

There are few explanations that can explain why we need to concern about the adolescent emerging to the young adults. The issues of adolescent and emerging adult can be categorized into two parts which are internalizing or externalizing. Internalizing problems happen when people turn their troubles inward. The instances of the internalizing problem are anxiety and depression. Adversely, when individuals turn their troubles outward are called externalizing problem. The instance of an externalizing issue is juvenile delinquency. The interaction between biological, psychological, and social factors to trigger the problems that adolescents, emerging adults establish is known as the Biopsychosocial approach (Santrock, 2013).

Students who after graduate from the high school, might face many issues in the world, such as work, further studies, and many problems that might be encounter. Moreover, providing an appropriate education might help the students to give an idea of how to cope with stress, depression or other mental illnesses.

### **Statement of Problem**

Mental health literacy (MHL) has developed into a tool to improve the recognition of mental illnesses (Gulliver, Griffiths, & Christensen, 2010), as well as prevention and treatment (Tay et al., 2018). Past studies mentioned that there is a pressing need to implement mental health programs for young people, particularly in the improvement of knowledge, stigma reduction and promotion for intentions of help-seeking (Campos, Dias, Duarte, Veiga, Dias, Palha, 2018; Ibrahim et al., 2017; Kutcher, Wei, Costa, Gusmão, Skokauskas, & Sourander, 2016; Campos, L., Dias, P., Duarte, A., Veiga, E., Dias, C., & Palha, F. 2017).

Previous studies showed that promoting MHL in secondary school population through education workshops have a significant reduction of stigma, improvement in knowledge

about mental health in Hong Kong (Chan, Mak, & Law, 2009), Western countries (Naylor, Cowie, Walters, Talamelli, & Dawkins, 2009; Essler, Arthur & Stickley, 2006) and help-seeking behaviour in Western context (Wright, McGorry, & Harris, 2006; Rickwood, Cavanagh, Curtis, & Sakrouge, 2004). However, secondary school students in Malaysia are moderately ignore the mental health problem, and the mental health awareness and wellbeing promotion are still inadequate in Malaysia (Nik Mustafa, Habil, Ibrahim, & Hassan, 2015). Ke et al. (2015) illustrated that even a brief one-hour workshop can effectively reduce mental illness stigma to the aspect of desire for social distance. Past study by Perry, Petrie, Buckley, Cavanagh, Clarke, Winslade, Hadzi-Pavlovic, Manicavasagar, and Christensen (2014) showed significant improvement in MHL and decreased stigma in adolescents by implementing a school-based education program in a randomised controlled trial experiment.

Besides, a study conducted by Yeap and Low (2009) described that many Malaysians did not have sufficient knowledge of mental health and they suggest the ability to recognise specific and common mental problems such as early signs and symptoms, interventions, coping strategies and etc. should be conveyed to the public to promote better understanding. The poor MHL can cause the mental disorder being poorly recognized and the delay of treatment (Tay et al., 2018). Mental health literacy is especially important to adolescent as it shows direct effect to early recognition and intervention of mental health problems, moreover, age of 14 is the onset age for half of mental health illnesses and a 75% increase in prevalence by age of 24 (Attygalle, Perera, & Jayamanne, 2017).

Adolescence is an essential stage of risk for the onset of psychiatric symptoms (Yamaguchi et al., 2011; Nik Mustafa et al., 2015), particularly the first onset of depression (Stange, Connolly, Taylor, Hamilton, Hamlat, & Abramson, 2016). However, there are only a few related studies conducted with Malaysian youth (Ibrahim et al., 2017; Amit, Ibrahim, Mohd Jaladin, & Che Din, 2017; Lee & Syaid, 2017; Latiff, Tajik, Ibrahim, Abubakar, &

Albar Ali, 2016; Choon, Abu Talib, Yaacob, Awang, Tan, Hassan, & Ismail, 2015; Khan, Sulaiman, & Hassali, 2010; Yaacob, Juhari, Abu Talib, & Uba, 2009) and none of the study related to any practical intervention have done for adolescents in Malaysia. Although there are studies on the effectiveness of different type of mental health intervention in Western context in various age groups (Sampogna, Bakolis, Evans-Lacko, Robinson, Thornicroft, & Henderson, 2017; Gronholm, Henderson, Deb, & Thornicroft, 2017; Thornicroft, Mehta, Clement, Evans-Lacko, Doherty, Rose, Koschorke, Shidhaye, O'Reilly, & Henderson, 2016; Imamura, Kawakami, Tsuno, Tsuchiya, Shimada, & Namba, 2016), and particularly school-based educational workshop for secondary school context (Ke et al., 2015; Chan et al., 2009; Naylor et al., 2009; Hoven, Doan, & Musa, 2008; Essler et al., 2006; Pinfold, Toulmin, Thornicroft, Huxley, Farmer, & Graham, 2003; Pinfold, Stuart, Thornicroft, & Arboleda-Flórez, 2005), but these results cannot be generalized in Malaysian adolescents which born in a multiracial and multicultural context. In this study, we place our attention on high school students, as education is a powerful tool for us to educate the students about mental health awareness, we are going to carry out mental health workshop to convey the important messages to address this issue.

### **Research Objectives**

**General objective.** This research aimed to examine the effectiveness of brief mental health workshop on mental health literacy in the areas of mental health knowledge, mental illness stigma, and help-seeking behaviour from mental health professionals among the secondary school students in Malaysia.

#### **Specific objectives.**

1. To investigate a gender difference in mental health knowledge among secondary school students before attending the workshop.

2. To investigate a gender difference in mental illness stigma among secondary school students before attending the workshop.
3. To investigate a gender difference in help-seeking behaviour among secondary school students before attending the workshop.
4. To determine the effectiveness of a brief mental health workshop in improving knowledge of mental health.
5. To determine the effectiveness of a brief mental health workshop in reducing the stigma for a mental health issue.
6. To determine the effectiveness of a brief mental health workshop in decreasing the stereotype endorsement.
7. To determine the effectiveness of a brief mental health workshop in term of reducing the desire for social distance with someone with a mental health problem.
8. To determine the effectiveness of a brief mental health workshop in enhancing the help-seeking behaviours.

### **Research Questions**

1. Is there a gender difference in the mental health knowledge exists among secondary school students in the pre-test?
2. Is there a gender difference in the mental illness stigma exists among secondary school students in the pre-test?
3. Is there a gender difference in the help-seeking behaviour exists among secondary school students in the pre-test?
4. Is there an improvement in the mental health knowledge after attending the workshop?

5. Is there a reduction in the level of stigma for mental disorders after attending the workshop?
6. Is there a reduction in the stereotype endorsement after attending the workshop?
7. Is there a reduction in the desire for social distance with an individual with mental disorder after attending the workshop?
8. Is there an improvement in the help-seeking behaviour after attending the workshop?

### **Research Hypotheses**

H<sub>1</sub> : There is a gender difference in the mental health knowledge among secondary school students in the pre-test.

H<sub>2</sub> : There is a gender difference in the mental illness stigma among secondary school students in the pre-test.

H<sub>3</sub> : There is a gender difference in the help-seeking behaviour among secondary school students in the pre-test.

H<sub>4</sub> : There is a significant increase in the mental health knowledge before and after attending the workshop.

H<sub>5</sub> : There is a significant decrease in the level of stigma for mental disorders before and after attending the workshop.

H<sub>6</sub> : There is a significant decrease in the level of stereotype endorsement before and after attending the workshop.

H<sub>7</sub> : There is a significant decrease in the level of desire for social distance before and after attending the workshop.

H<sub>8</sub> : There is a significant increase in the level of help-seeking behaviour before and after attending the workshop.

### **Significance of The Study**

Majority of the interventions conducted in adolescent population was led by experts (Pinfold et al., 2005), have duration from two hours (Economou, Louki, Peppou, Gramandani, Yotis, & Stefanis, 2012) to few weeks (Schulze, Ritcher-Werling, Matschinger, & Angermeyer, 2003), or combined educational and video-based contact condition to target stigma as well as improve mental health literacy as a whole (Chan et al., 2009; Naylor et al., 2009; Pinfold et al., 2003). These findings illustrated that a mental health workshop in them of educational delivery or combined both education and video-based contact condition (e.g. video of individual with mental health issue) can exhibit positive outcomes in the areas of mental health literacy that we are going to study which are mental health knowledge, mental illness stigma, and help-seeking behaviour.

In the process of literature review, it was noticed that there were limited sources that related to mental health workshop in Malaysia context. Most of the past studies were established in Western country, fewer studies were conducted in Asian countries especially South East Asian countries which Malaysia located. Thus, this study can answer how a brief mental health workshop affects the mental health literacy on Malaysian adolescence which born in a multiracial and multicultural society.

In addition, this study is important in terms of evaluating the effectiveness of this mental health modules as it could be served as a powerful tool to educate the student by raising their awareness towards mental health issues. Besides, this study can understand the effectiveness of mental health workshop on the secondary school students that may accelerate the preventions and encourage early interventions. In a nutshell, this research is important to test the effectiveness of brief mental health workshop as well to examine the knowledge, stigma, and help-seeking behaviour of mental health on secondary school students within the Malaysia context to fill up the knowledge gap.

### **Conceptual and Operational Definition of Terms**

**Mental health literacy.** Mental health literacy is a term that was first introduced in the past two decades and it defined as “knowledge and beliefs about mental disorders that help them to recognize, manage and prevent” (Jorm, Korten, Jacomb, Christensen, Rodgers, & Pollitt, 1997).

The operational definition of mental health literacy is evaluated by four components mentioned by Kutcher et al. (2016) which are knowledge to gain and maintain positive mental health, knowledge of mental illnesses and its remedies, reduce stigma to mental illnesses, and enhancing intentions for help-seeking. These important criteria of mental health literacy will be measured by Mental Health Knowledge Schedule (MAKS), questionnaire measuring mental illness stigma used by Ke et al. (2015), and Attitudes Toward Seeking Professional Help (ATSPPH-SF).

**Mental health knowledge.** The enhancement of mental health knowledge among the public can prompt several positive outcomes on mental illness stigma, facilitate intention of help-seeking, and increase the proportion of individuals with mental health issue getting treatment in future (Evans-Lacko, Little, Meltzer, Rose, Rhydderch, Henderson, and Thornicroft, 2010). In this study, the mental health knowledge will be measured by Mental Health Knowledge Schedule (MAKS) which crafted by (Evans-Lacko et al., 2010).

**Mental illness stigma.** Mental illness stigma is being defined as a set of negative attitudes and beliefs that motivating fear, rejection, avoidance, and discrimination against the individual with mental illness and it also relates with many chronic health conditions, causing much suffering to those who are stigmatized (Mash & Wolfe, 2018; Brakel, 2006).

The operational definition of mental illness stigma is measure by the 19-items questionnaire measuring mental illness stigma used by Ke, Lai, Yang, Wang, and Austin

(2015) which consists of two subscale which are stereotype endorse and desire for social distance. The higher the score indicates stronger mental illness stigma.

**Stereotype endorsement.** Stereotype endorsement is an automatic process, working at a preconscious level (Gaertner & McLaughlin 1983; Macrae, Milne, & Bodenhausen, 1994). In this study, stereotype endorsement is measured by a subscale of questionnaire measuring mental illness stigma used by Ke et al. (2015).

**Desire for social distance.** Desire for social distance is being referred as a measurement for a person's willingness to interact with individual who is mentally ill, and may having linkage to discrimination against individual who is mentally ill (Lauber, Nordt, Falcato, & Rössler 2004; Link & Phelan 2001), hence, reduction for this aspect of stigma is fairly important (Link & Phelan 2001).

The operational definition of desire for social distance is examine by the subscale of questionnaire measuring mental illness stigma used by Ke et al. (2015). The lower the score of this subscale, the lower the desire for social distance. In other words, individual who scores lower in this subscale are more willing to interact with an individual with mental illness.

**Mental health workshop.** Mental health workshop provides training to the participants to be well equipped with knowledge and confidence to recognize and respond to mental disorders surrounding us. It helps reduce stigma, improve mental health literacy and raise awareness of youth mental health (Kutcher & McLuckie, 2013). In this study, the few aspects of mental health literacy such as knowledge, decrease of stigma, help-seeking intention, and biology factor of mental illness will be covered in our mental health workshop.

## **Chapter 2 Literature Review**

### **Introduction**

As stated by the National Health and Morbidity Survey (NHMS) reported that in Malaysia the prevalence of mental health issues for individuals aged 16 and above by 2015 was more than one quarter of the population from only 10.7% in 1996 (NHMS, 2015), this group of people are required immediate attention or remedial actions (Ministry of Health Malaysia, 2017). This finding has shown that adolescents aged 16 and above in Malaysia are at risk of mental health issues as adolescence is an essential stage of risk for the onset of psychiatric symptoms (Yamaguchi et al., 2011), particularly the first onset of depression (Stange et al., 2016). Based on the findings from Malaysia Global School-based Health Survey (GSHS) 2012, the prevalence of depression among adolescents is 17.7% (as cited in Kaur, Cheong, Naidu, Kaur, Manickam, & Noor, 2015), and particularly students who living with stress academic experiences are at high risk (Khan, Sulaiman, & Hassali, 2010). Therefore, these findings show that there is an urgent need to implement psychoeducational workshop in Malaysia secondary school to educate the schooling adolescents who aged 16 and above and evaluate the effectiveness of the workshop.

### **Gender Differences in Mental Health**

Statistics were done by the WHO shows there is an obvious gender difference for the lifetime risk of depression in South East Asia region, males illustrated a rate 7 to 12 percent whereas for females is relatively higher at a rate of 20 to 25 percent (WHO, 2007). However, despite the fact that females are more vulnerable to mental illness such as depression. Female are having higher mental health literacy levels than males, especially in term of ability to recognise mental illnesses (Tay et al., 2018; Chong et al., 2016), and help-seeking behaviours from both formal and informal helper as compared to male who preferred coping alone (Tay et al., 2018) or delay the action of seeking-help (Chong et al., 2016).

Among adolescents with suicidal thoughts show an obvious gender difference, data illustrated with 10.5% of boys and 17.5% girls was having suicidal thoughts (O'Donohue, Benuto, & Tolle, 2013). Even in a study conducted in Malaysia showed that females have higher vulnerability to mental health issues compared to males during adolescence, however, female adolescents experience higher amounts of negative affectivities compared to their male counterparts, especially in term of higher social stress, lower self-esteem, higher symptoms of depression (Yaacob et al., 2009).

### **Mental Health Literacy in Adolescents**

Past studies depicted that most mental disorders develop during young age, and approximately about half of all cases of diagnosed mental illnesses reported in adulthood onset at aged 14 (WHO, 2018; Kessler, Berglund, Demler, Jin, Merikangas, & Walters, 2005; Belfer, 2008; WHO, 2008). Campos et al. (2018) mentioned there is an immediate need to carry out interventions that portray positive outcomes in term of mental health literacy promotion for adolescents, particularly in the knowledge enhancement and mental health issues related stereotype reduction, promotion of positive attitudes of first aid strategies and help-seeking intentions, and development of self-help abilities.

### **Mental Illness Stigma and Adolescents**

Public stigma commonly known as externalized stigma refers to negative attitudes such as prejudice, beliefs such as stereotypes and behaviours such as discrimination against other people in society with mental health issues such as depression, schizophrenia and suicidal ideation (Corrigan, 2004). Moreover, self-stigma which is also known as internalized stigma are prejudice, stereotypes, and discrimination concerning an individual's own mental health issues (Corrigan, 2004). For an adolescent, the fear of being stigmatized by peers is considered to be a major disincentive to seek the necessary treatment for mental health rather than a lack of knowledge of the resources available (Zhao et al., 2015).

The stigma associated with mental illness issues is obvious to people at an early age, however, young people's attitudes are malleable and easier to change than adults' attitudes (Corrigan & Watson, 2007). Therefore, it is crucial to invest in promoting literacy in mental health in this targeted group. Whereas, for Malaysia context, Nik Mustafa et al. (2015) mentioned stigma and discrimination seems to be a major barrier that discourages youth with mental illness and their families from seeking help and necessary treatment. Contact-based education has become the most popular and effective method for working with young people (Gronholm et al., 2017).

### **School-based Interventions and Adolescents**

Students hold a high risk of depression as compare to the general public due to stressful academic events and environmental causes which can elicit depression, anxiety, suicidal ideation and so forth (Khan, Sulaiman, & Hassali, 2010; Lee & Syaid, 2017). This statement plausibly shows adolescents who are studying is especially high in risk for diagnosis of mental health issues and we should take school-based interventions or workshop as our reference for the study.

Mental Illness Education Australia is a school-based educational mental health workshop that aimed at stigma reduction, enhance mental health literacy and help-seeking behaviours in secondary school students through the delivery of information and awareness related to mental illnesses by a presenter. The result of pre- and post- test showed significant enhancement in mental health literacy, moderate improvement in stigmatising attitudes, and slight improvements in help- seeking behaviours (Kelly, Jorm, & Wright, 2007). Mental Health Awareness in Action program which conveyed the information about mental disorder in two one-hour sessions which aimed to enhance knowledge of mental disorder and reduce stigma in secondary schools. The results of pre- and post- test and a one-month follow-up

depicted significant enhancement in stigmatising attitudes and mild improvements in mental health knowledge (Kelly, Jorm, & Wright, 2007).

Headstrong is a universal, curriculum-based psychoeducational program and it covered the syllabus of mental health and self-development which consists of five modules which are mood and mental wellbeing, the low down on mood disorders, reaching out, helping yourself, and making a difference (Perry et al., 2014). Headstrong classroom activities are conducted over five to eight weeks, amounted an approximation of 10 hours of class duration (Perry et al., 2014). The result of randomized controlled trial illustrated that there were positive significant results shown by HeadStrong for both mental health knowledge and stigma reduction, however, no significant results was shown on participants' help-seeking intentions (Perry et al., 2014).

Besides these published interventions, there are numerous studies was adapting self-created psychoeducational classroom intervention that showed significantly increase in mental health knowledge, decrease stereotypes related to mental health problems, and increase help-seeking behaviour (Campos et al., 2018). Moreover, self-created educational session with video or drama presentation which targeted secondary school students showed significance improve in mental health knowledge (Chan et al., 2009; Naylor et al., 2009; Pinfold et al., 2003), positive attitude towards mental health issues (Chan et al., 2009; Naylor et al., 2009; Essler et al., 2006), and stigma reduction (Chan et al., 2009).

Brief one-hour classroom workshop on mental illness stigma for secondary school students which the authors classified mental illness stigma into the measurement of two subscales which is stereotype endorsement and desire for social distance (Ke et al., 2015). They defined the desire for social distance is measure of a person's acceptance to interact with mentally ill individual. The results of pre- and post- test illustrated the significant decrease in mental illness stigma in the term of desire for social distance but no changes in

stereotype endorsement (Ke et al., 2015). The authors hypothesize the content of the workshop might emphasized more on improvement in the desire for social distance and insufficient information for the reduction in stereotype endorsement. The question raises for the measure of stereotype endorsement for the future study (Ke et al., 2015).

### **Theoretical Framework**

**Health belief model (HBM).** This model proposes four types of health beliefs that influence a person's health behaviour, in this case, the help-seeking behaviour of mental health: perceived susceptibility, perceived severity, perceived barriers, and perceived benefits (Janz, Champion, & Stretcher, 2002). Perceived susceptibility to the condition refers to how vulnerable the individual feels to the illness (Henshaw & Carol, 2009), from an extension of low to high. Perceived severity of the illness refers to believe that illness could lead to serious consequences (Henshaw & Carol, 2009), such as mortality and morbidity. Perceived barriers refer to how the advantages of taking action outweigh the barriers to enrol in action, for instance, shortage of time, convenience, transportation and so forth that could affect the decision making of an individual with mental illness to seek help from mental health professional. Lastly, perceived benefits refer to an extension of a specific action is on expectancy to decrease the risk of obtaining the condition or the outcomes of the condition. In this case, individuals would be more likely to increase in help-seeking behaviour if people perceived themselves as vulnerable to a psychiatric disorder, that psychiatric disorders have severe outcomes or even deadly, and that advantages of seeking help from mental health professions outweigh barriers. The *Figure 1* below is adapted from Simons-Morton, Greene, and Gottlieb (1995).

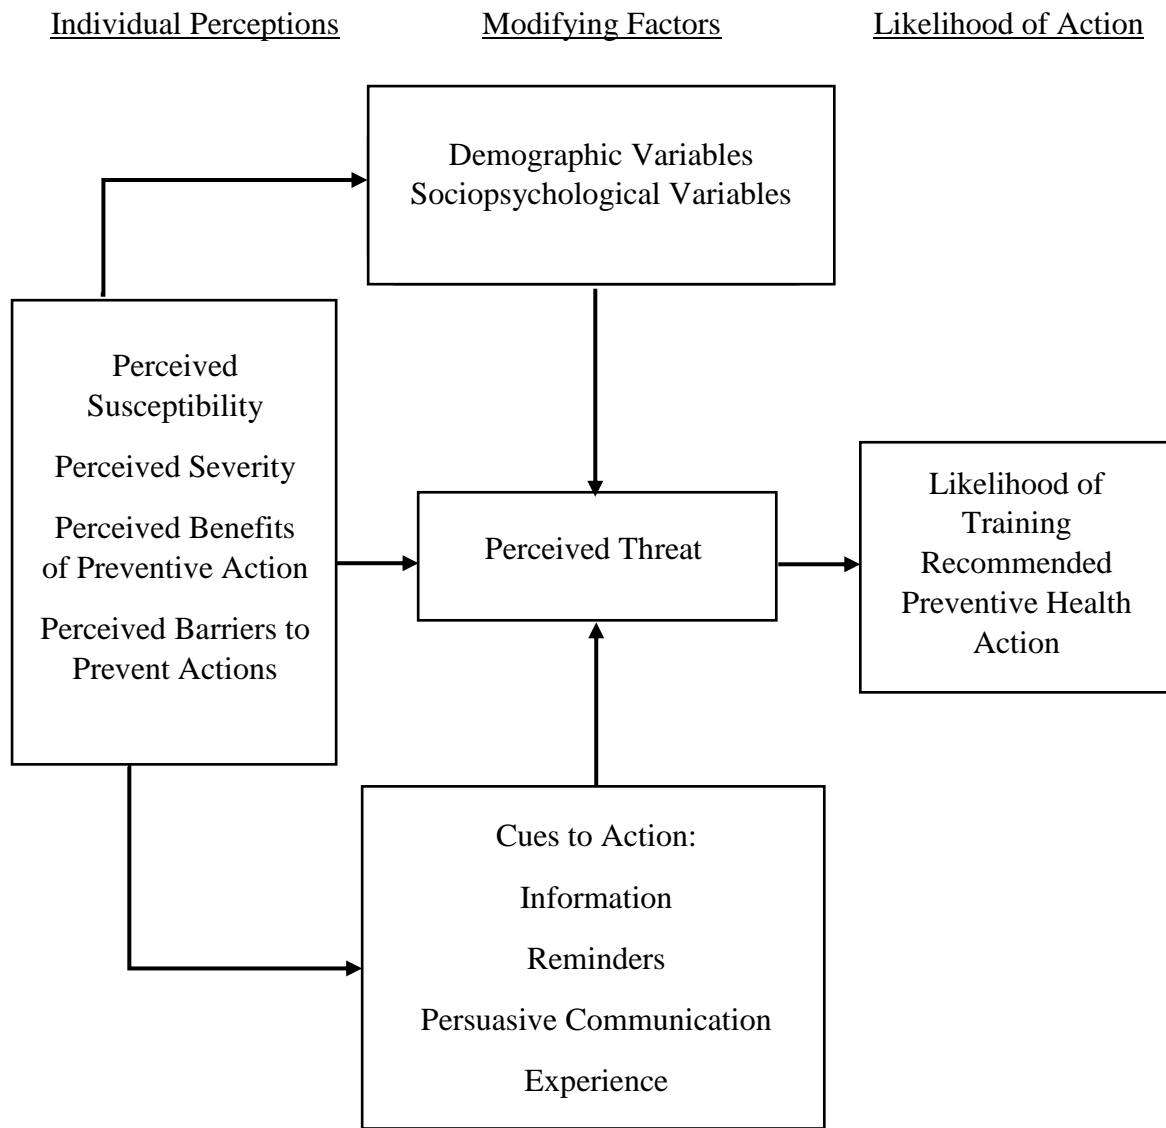

Figure 1. The theoretical framework of health belief model (HBM).

### **Conceptual Framework**

The elements of HBM, such as a one's perception of effectiveness of mental health treatment and even own perception of stigma in the community, portray to affect his or her decision to use mental health services (Richardson, Morgenstern, Crider, & Gonzalez, 2013). One's decision to start a health behaviour is influenced by two major segments which are individual perceptions and modifying factors. Simons-Morton et al. (1995) noted that the effectiveness of treatment is less important than the perception of the patient believe on how effectiveness it to be. The course of action in mental health can be happened through the sequence of HBM. First for the perceive susceptibility, individual might doubt how susceptible he or she to the mental illness, for example, individuals who believe they are at risk for mental disorders, are more likely to take precautions and seek consultation from mental health specialists. Second, the perceive severity refers to the individual thought of how serious the mental illness to his or her health, for instance, individual who believe mental disorders such as depression is catastrophic will more likely to seek help from mental health services. Third, perceive benefits refers to individuals who believe seeking-help from mental health professional could benefit them in term of recovery or prevention from more serious mental illness are more willingly to seek for help. Lastly, barrier such as concerning the cost of treatment. Individuals who believe mental health services are expensive may denial their mental health condition or reluctant to go for treatment. Therefore, a brief mental health workshop would be served as a factor which targeted to change the overall mental health literacy at the post-workshop as the likelihood of action.

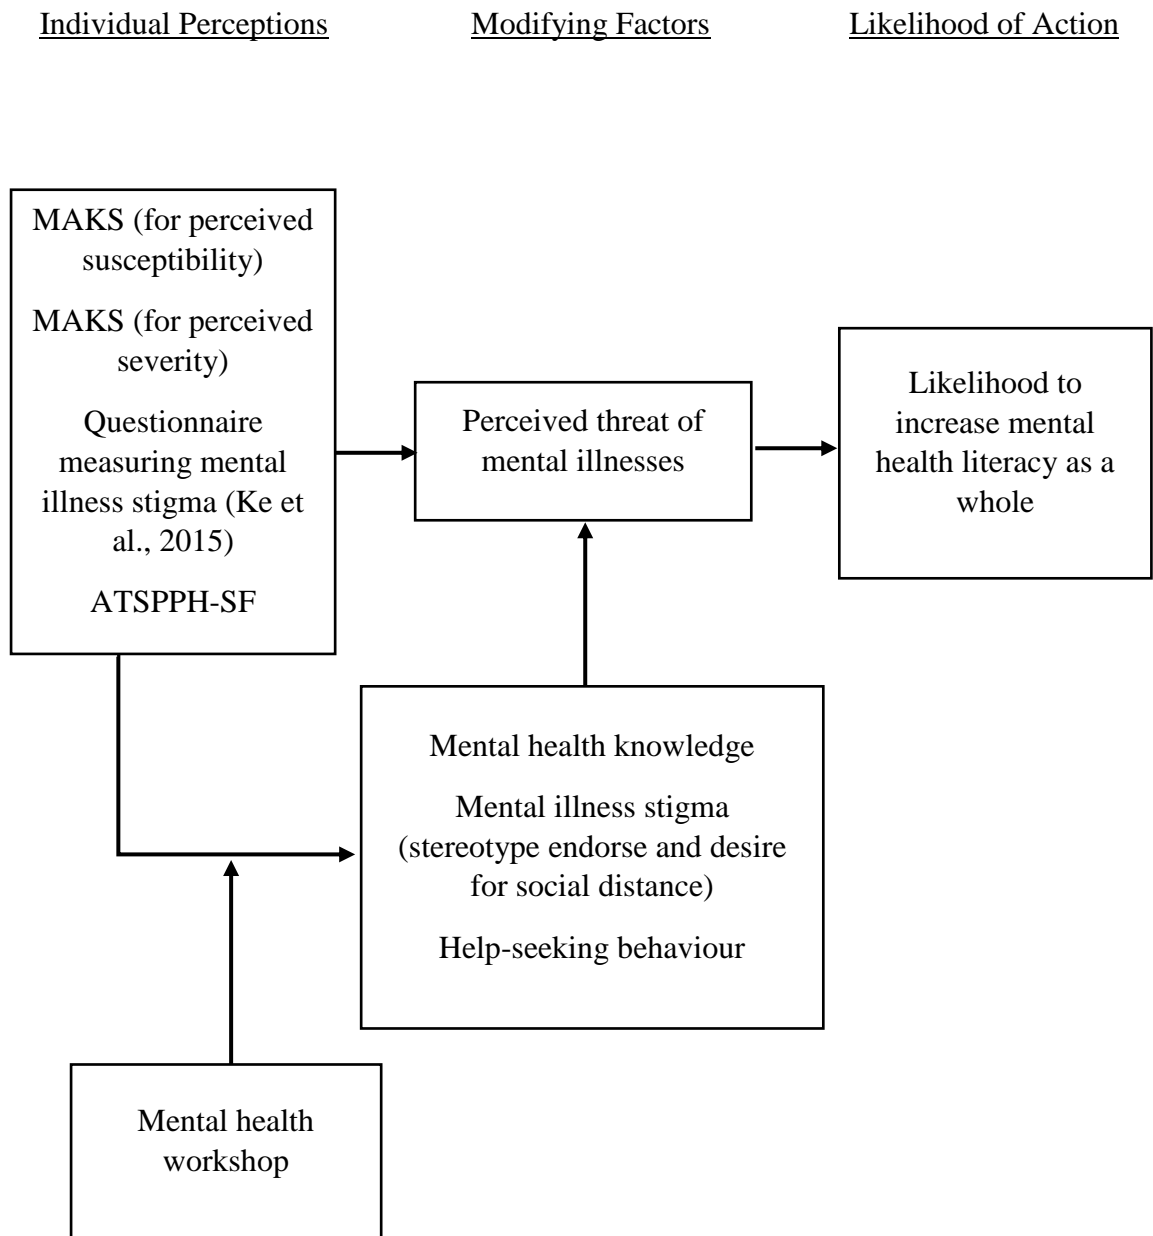

Figure 2. The conceptual framework of health belief model (HBM).

## **Chapter 3 Methodology**

### **Introduction**

This chapter of methodology consists of the explanations for ethical consideration, research design, participants, instruments, research procedures, and analysis of data that have been used in this research study.

### **Ethical Consideration**

This research has been approved by the scientific and ethical review committee by the Universiti Tunku Abdul Rahman with the ethical code number of U/SERC/15/2019. The ethics committee approval letter is attached as Appendix A.

### **Research Design**

This study employed a cross-sectional quasi-experimental quantitative pre-post research design with the aim to identify the effectiveness of brief mental health workshop in improving mental health knowledge, help-seeking behaviour and mental illness stigma reduction all together to increase mental health literacy as a whole. Our study combined the mechanisms of cross-sectional which defined as “an observational study design that used to measures the outcome and the exposures in the study participants at the same time” (Setia, 2016), and quasi-experiment which is an empirical interventional research design which could predict the causal effect of an intervention on the sample without random assigned (Dinardo, 2008), before and after the experimental manipulation . The participants were required to complete a set of structured questionnaire pertaining mental health literacy in the areas of mental health knowledge, mental illness stigma, and attitudes toward help-seeking from mental health professionals at two time points (T1, before the mental health literacy workshop, on paper), and (T2, immediately after the mental health literacy workshop, on paper).

## **Participants**

94 secondary school students from a town in Perak, Malaysia were participated in our study, this target group was selected based on non-probability sampling method which called purposive sampling. Before proceeding to data collection, G-power software was employed to calculate a potential sample size that is required for the study to attain .05 effect size. The estimated number of participants is 54 students. The workshop was scheduled on a normal schooling day. The participants were Senior One and Senior Two students aged between 16 to 19. A non-probability sampling method which was voluntary response sampling was used. A set of structured questionnaires with a demographic sheet (as attached in Appendix D) was given to the respondents in the form of paper-and-pencil. The age group of participants was chosen as our research subject is because it is an emerging stage to adulthood and most onset of mental illnesses are start from this age range (WHO, 2018; Yamaguchi et al., 2011; Kessler et al., 2005; Belfer, 2008; WHO, 2008). Both the informed consent and parental consent (as attached in Appendix B) was distributed the students and their parents or legal guardian to read and by signing it to acknowledge their understanding and agreement with the terms and conditions of our study, and the signed consents have to be returned back to the researchers few days before the workshop.

## **Instruments**

**Demographic sheet.** A demographic sheet was created to collect data on student ID, gender, race, age, stream of study, and personal experience or someone that one's close to with mental illness.

**General Health Questionnaire – 28 (GHQ-28).** The GHQ-28 is a mental health screening tool developed by Goldberg (1978) was employed to detect the mental health condition of the target participants. GHQ-28 consists of 28 items which measure the risk of developing mental illnesses that divided into four subscale which are “somatic symptoms

from questions 1 to 7, anxiety or insomnia symptoms from questions 8 to 14, social dysfunction from questions 15 to 21, and severe depression measured by questions 22 to 28” (Goldberg, 1978, as cited in Sterling, 2011, p. 259). The proposed time to complete is less than five minutes. The example of question measuring somatic symptoms is “been getting any pains in your head?”, for measuring anxiety is “felt constantly under strain?” and insomnia is “had difficulty in staying asleep once you are off?”, example question for social dysfunction is “been managing to keep yourself busy and occupied?”, and for measuring severe depression is “found yourself wishing you were dead and away from it all?”. The GHQ-28 was reported to have a test-retest reliability of .78 to .90 (Robinson & Price, 1982). The group results of GHQ-28 will be shared with the school authority for the awareness of prevention purpose in the future.

**Mental health knowledge schedule (MAKS).** The MAKS is a mental health knowledge assessment constructed by Evans-Lacko et al. (2010), and was employed to measure the mental health knowledge of the target participants. MAKS consists of 12 questions, with six point-Likert scale. Students need to answer the questions by ticking the box. MAKS is free to use for non-profit purposes if no changes are made to the scale. MAKS comprises six areas of “knowledge related to stigma in mental health which are help seeking, recognition, support, employment, treatment, and recovery” (Evan-Lacko, 2010, p. 442). The item for recovery is “People with severe mental health problems can fully recover.”. “The overall internal consistency among items 1 to 6 was moderate with a Cronbach’s  $\alpha$  of .65” (Evans-Lacko et al., 2010, p. 444). A systematic review on psychometric properties of MAKS showed a preferred reliability and an acceptable construct validity for use in research and practice (Wei, McGrath, Hayden, & Kutcher, 2016).

**Questionnaire measuring mental illness stigma.** This questionnaire is adopted from Ke et al. (2015). It was a modified version of questionnaire that originally created by Schulze

et al. (2003). It is free for research use. This mental illness stigma questionnaire consists of 19 statements included the first 7 questions of which inquire about the likelihood of stereotypes endorsement on individuals with mental illness, and the subsequent 12 questions of which inquire about the willingness to involve in several sorts of social relationships with individual with mental illness, also known as desirability of social distance. Items are rated on a three-point Likert scale of a 0- to 1-point scale, which 0 represents low stigma, 0.5 represents unsure, and 1 represents high stigma (Ke et al, 2015). The sample question for stereotype endorsement is “Someone who has a mental illness cannot cope with stress before exams” whereas for desire for social distance is “I would feel embarrassed or ashamed if my friends knew that someone in my family has mental illness.”. On average, the stereotype scale with a Cronbach’s  $\alpha$  of .72 and the social distance scale with a Cronbach’s  $\alpha$  of .83 (Schulze et al., 2003). The scale is claimed to be valid in measuring mental illness stigma on secondary school students (Schulze et al., 2003).

#### **Attitudes toward seeking professional psychological help short form version**

**(ATSPPH-SF)**. ATSPPH-SF is the simplified version of attitudes toward seeking professional psychological help (ATSPPH). ATSSPH-SF was created by Fischer and Farina (1995) and it consists of 10 questions with half of them are reserve scoring items. ATSPPH is free to use and is no permissions required to the administer (Fisher & Farina, 1995). Items are rated on a four-point Likert scale of a 0- to 3-point scale to indicate from disagree to agree. The higher the scores the greater the attitudes toward help-seeking from mental health professionals. The example for the question is “If I believed I was having a mental breakdown, my first inclination would be to get professional attention.” whereas the instance for reverse score item is “Personal and emotional troubles, like many things, tend to work out by themselves.”. ATSPPH-SF indicated a good fit, high factor loading, and good reliability (Picco et al, 2016). There was a high correlation shown between the 10 items ATSPPH-SF

and the original 29 items ATSPPH which was .87 (Fisher & Farina, 1995). For its criterion validity, a study showed that “college students who were received mental health service scored significantly higher ( $M = 20.50$ ,  $SD = 5.21$ ) than non-users ( $M = 16.63$ ,  $SD = 5.09$ ),  $F(1,294) = 19.00$ ,  $P < .001$  (Cohen's  $d=0.74$ )” (Elhai, Schweinle, & Anderson, 2008, p. 324).

**Brief mental health workshop.** Participants received a 50 minutes mental health workshop was conducting accordance to mental health modules crafted by TeenMentalHealth.org with adaptation to fit the duration of the workshop and the cultural context. Besides, the overall content is reproduced with the kind permissions of TeenMentalHealth.org, Prof. Dr. Stan Kutcher (personal communication, January 25, 2019, as attached in Appendix C), Pintar Foundation, and Universiti Tunku Abdul Rahman. It is a professional driven module which covered the facts, myths, biological factor and other information about mental health. Participants were given a chance to question any mental health question that linked to the workshop content upon the completion of workshop.

### **Research Procedures**

**Recruitment of participants.** After constructing the questionnaire and the workshop material, an email was sent to multiple independent high school in exploring for the research opportunity. Once some schools are showing interest in providing us a research opportunity, we went to these schools for a face-to-face discussion with the teacher-in-charge to discuss further details and the collaborative possibility. Once we confirmed the location of study, arrangements of study were discussed and planned between researchers and the school authority to fulfil the criteria such as number, gender, and age group of participants as well as adequate duration of workshop. The informed and parental consent were distributed in the form of paper-and-pencil through the school authority to the participants few days prior to experimentation.

**Pre-mental health literacy measurement.** GHQ-28, MAKS, Questionnaire measuring mental illness stigma, and ATSPPH-SF were included in the set of structured questionnaires were given to the secondary school students to answer before the mental health workshop begins. A short briefing was given to the participants about the answering method and they are allowed to question about any vocabulary or sentence that they are unsure of. The suggested time to complete this set of questionnaires is about 15 minutes, and a maximum of another 5 minutes was given to the participants who were unable to finish on time.

**Brief mental health workshop.** The workshop was conducted with the sequence in the ascending order of acknowledgement, stigma: myths and realities of mental illness, understanding the relationship between mental health and mental illness, some common mental disorders in young people, and treatments and recovery. The total duration of the workshop was around 50 minutes, with the questions and answers session included.

**Post-mental health literacy measurement.** The same set of structured questionnaires without the mental health screening tool GHQ-28 were given to the participants the next day after the mental health workshop. The distribution and collection of questionnaires were processed through the assists of school authority as that day was a schooling day, the participants were only allowed to answer during the school assembly which have no clash with any classes. The answered questionnaires were collected from the school authority by the researchers another day after the post-test.

### **Analysis of Data**

Data collected will be analysed by using the Statistical Package of Social Science (SPSS). The total scores of GHQ-28, MAKS, Questionnaire measuring mental illness stigma, and ATSPPH-SF will be shown in mean, standard deviation, and frequency distribution as for descriptive statistics. Besides, in term of inferential statistics, paired samples t-test and

independent samples t-test were employed to generate the statistical evidence in answering our research questions.

Independence samples t-test was employed to analyse the gender difference in areas such as mental illness knowledge, mental illness stigma, and help-seeking behaviour from professional. There are four assumptions to be considered before proceeding to this test which includes the dependent variables (DVs) in this case are our set of scores should be interval or ratio data that are continuous, each participant are only allowed to participate in the research once, and should not influence or distract the participation of other participants, every set of scores for DVs should be approximately normally distributed, and every set of scores should fulfil the criteria of homogeneity of variances that consists of equal amount of variability .

Paired sample t-test was used to analyse the statistical significant difference between mean scores of the pre- and post- test of MAKS, questionnaire measuring mental illness stigma, and ATSPPH-SF. Generally, there are three assumptions for analysing of data using this test which includes the scores for DVs must be continuous can be either ratio or interval data, each group of scores for DVs should be approximately normally distributed, and the differences between pair of scores for DVs should be approximately normally distributed.

Few expectations were made based on the past findings. The gender difference in term of areas such as mental illness knowledge, mental illness stigma, and help-seeking behaviour from professional and the positive outcomes should be shown in the three areas of mental health literacy after attending the workshop. According to past findings, the mean scores of three questionnaires that measure three dependent variables which are mental health knowledge and attitudes toward help-seeking from mental health professionals should increase and the mean score for mental illness stigma should decrease as the effects of participation in the mental health workshop.

## Chapter 4 Findings and Analysis

### Background of Respondents

The demographic information of the 94 participants in this study have been tabulated in the Table 4.1. There were 54 (57.45%) of males and 40 (42.55%) of females participated in the study. The study was participated by majority of Chinese (98.94%) and only an 1.06% of Malay ethnicity. The age range of the participants were from 16 to 19 years, the majority of participants were in the age of 16 (72.34%), followed by the age of 17 (21.28%), the age of 18 and 19 were the minority (5.32% and 1.06% respectively). For the stream of study, there were 73.40% of students who are studying art stream and 26.60% of students who are studying science stream. Besides, for the question inquire personal experience of or someone close to you experienced with mental illness shown a majority of 70.21% of participants answered 'No' and 29.79% answered 'Yes'.

Table 4.1

#### *Demographic of Respondents*

	Frequency	Percentage (%)
<b>Gender</b>		
Male	54	57.45
Female	40	42.55
<b>Ethnic</b>		
Malay	1	1.06
Chinese	93	98.94
<b>Age</b>		
16	68	72.34
17	20	21.28
18	5	5.32
19	1	1.06
<b>Stream of Study</b>		
Art	69	73.40
Science	25	26.60
<b>Mental Illness Experience by Yourself or Someone Close to You</b>		
Yes	28	29.79
No	66	70.21

### **Scale of Measurement**

Continuous data which are interval or ratio data are required for both the paired sample t-test and independent samples t-test. Thus, the summation for total scores for each MAKS, questionnaire measuring mental illness stigma, and ATSPPH-SF were calculated for both pre- and post- test.

### **Normality of the Data**

The scores of MAKS, questionnaire measuring mental illness stigma, and ATSPPH-SF were tested in a normality test by using SPSS before proceeding into the paired-sample t-test and independent samples t-test to ensure the scores of these variables are normally distributed. The results of SPSS showed that all group of scores are normally distributed that fulfilled the principle of homogeneity (as attached in Appendix F).

### **Normality of Difference Scores**

The difference between the scores for pre- and post- test for each assessment stated above were calculated and inserted into a normality test by using SPSS before proceeding into the paired-sample t-test and independent samples t-test to ensure the differences between pairs of scores are approximately normally distributed. The results of SPSS showed that all differences between paired of scores are normally distributed that fulfilled the principle of homogeneity (as attached in Appendix F).

### **Reliability Test**

A Cronbach's Alpha reliability test was conducted to analyse the internal consistency of the items measuring the same construct. The result for MAKS indicated a questionable alpha coefficient of .63, questionnaire measuring mental illness stigma indicated a good alpha coefficient of .75, and ATSPPH-SF indicated a questionable alpha coefficient of .66. As stated in Giliem and Giliem (2003) the rule of thumb for Cronbach's alpha coefficient classified into few categories which are poor for alpha score below .60, questionable for

alpha score between .61 to .69, acceptable for alpha score between .70 to .79, good for alpha score between .80 to .89, excellent for alpha score .90 and above, and any score below .50 is considered unacceptable.

### Gender Difference

$H_1$  : *There is a gender difference in the mental health knowledge among secondary school students in the pre-test.*

An independent-samples t-test was conducted to compare the pre-test scores of MAKS and the gender. As shown in Table 4.2, there was no significant gender difference in the mental health knowledge was shown. Hence,  $H_1$  is rejected.

Table 4.2

*Results of t-test and Descriptive Statistics for Mental Health Knowledge by Gender in the Pre-test*

	Gender						95% CI for Mean Difference	<i>t</i>	<i>df</i>
	Male			Female					
	<i>M</i>	<i>SD</i>	<i>n</i>	<i>M</i>	<i>SD</i>	<i>n</i>			
Mental Health Knowledge	32.13	9.46	54	35.35	7.51	40	-6.82, .38	-1.78	92

$H_2$  : *There is a gender difference in the mental illness stigma among secondary school students in the Pre-test.*

An independent-samples t-test was conducted to compare the pre-test scores of questionnaire measuring mental illness stigma and its two subscales, and the gender. As shown in Table 4.3, higher pre-test scores were shown for the males ( $M = 8.41$ ,  $SD = 2.91$ ) than the females ( $M = 6.78$ ,  $SD = 2.76$ );  $t(92) = 2.75$ ,  $p < .01$ . Besides, a higher pre-test scores were shown on the subscale of desire for social distance for the males ( $M = 4.86$ ,  $SD = 2.42$ ) than females ( $M = 3.48$ ,  $SD = 2.30$ );  $t(92) = 2.81$ ,  $p < .01$ . However, no significant difference was shown on stereotype endorsement.

These results showed that gender difference exists on mental illness stigma in pre-test for mental illness stigma and desire for social distance. Hence, H<sub>2</sub> is supported.

Table 4.3

*Results of t-test and Descriptive Statistics for Mental Illness Stigma, Stereotype Endorsement, and Desire for Social Distance by Gender in the Pre-test*

	Gender						95% CI for Mean Difference	<i>t</i>	<i>df</i>
	Male			Female					
	<i>M</i>	<i>SD</i>	<i>n</i>	<i>M</i>	<i>SD</i>	<i>n</i>			
Mental Illness Stigma	8.41	2.91	54	6.78	2.76	40	.45, 2.81	2.75**	92
Stereotype Endorsement	3.54	.89	54	3.24	1.01	40	-0.91, .69	1.52	92
Desire for Social Distance	4.86	2.42	54	3.48	2.30	40	.41, 2.37	2.81**	92

Note: \* $p < .05$ . \*\* $p < .01$

H<sub>3</sub> : *There is a gender difference in the help-seeking behaviour among secondary school students in the pre-test.*

An independent-samples t-test was conducted to compare the pre-test scores of ATSPPH-SF and the gender. As shown in Table 4.4, there was no significant gender difference in the help-seeking behaviour was shown. Hence, H<sub>3</sub> is rejected.

Table 4.4

*Results of t-test and Descriptive Statistics for Help-seeking Behaviour by Gender in the pre-test*

	Gender						95% CI for Mean Difference	<i>t</i>	<i>df</i>
	Male			Female					
	<i>M</i>	<i>SD</i>	<i>n</i>	<i>M</i>	<i>SD</i>	<i>n</i>			
Help-seeking behaviour	14.98	5.11	54	14.90	5.38	40	-2.08, 2.25	.08	92

### Mental Health Knowledge Scale (MAKS)

H<sub>4</sub> : *There is a significant increase in the mental health knowledge before and after attending the workshop.*

A paired-sample t-test was conducted to determine the effect of the brief mental health workshop on MAKS in a group of secondary school students. Results as shown in Table 4.5. On average, a higher score is shown in MAKS after the mental health workshop ( $M = 38.02$ ,  $SD = 7.51$ ) than before the mental health workshop ( $M = 33.50$ ,  $SD = 8.79$ ). The difference was  $-4.52$ , 95% CI  $[-6.36, -2.69]$ , significant  $t(93) = -4.90$ ,  $p < .001$ , and indicated a medium effect size, Cohen's  $d = 0.55$ . Hence, H<sub>4</sub> is supported.

Table 4.5

*Results of t-test and Descriptive Statistics for Mental Health Knowledge*

	Pretest		Posttest		N	95% CI for Mean Difference	r	t	df
	M	SD	M	SD					
Mental Health Knowledge	33.50	8.79	38.02	7.51	94	-6.36, -2.69	.41***	-4.90***	93

Note: \*\*\* $p < .001$

### Questionnaire Measuring Mental Illness Stigma

H<sub>5</sub> : *There is a significant decrease in the level of stigma for mental disorders before and after attending the workshop.*

A paired-sample t-test was conducted to determine the effect of brief mental health workshop on questionnaire measuring mental illness stigma in a group of secondary school students. Results as shown in Table 4.6. On average, lower scores were shown in questionnaire measuring mental illness stigma after the mental health workshop ( $M = 6.28$ ,  $SD = 3.25$ ) than before the mental health workshop ( $M = 7.71$ ,  $SD = 2.94$ ). The difference was  $1.43$ , 95% CI  $[0.96, 1.90]$ , was significant  $t(93) = 6.04$ ,  $p < .001$ , and indicated a small

effect size, Cohen's  $d = .46$ . In regard to the two subscales of the questionnaire there was also lower scores shown in both stereotype endorsement and desire for social distance on the posttest. Hence,  $H_5$  is supported.

Table 4.6

*Results of t-test and Descriptive Statistics for Mental Illness Stigma*

	Pretest		Posttest		<i>n</i>	95% CI for Mean Difference	<i>r</i>	<i>t</i>	<i>df</i>
	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>					
Mental Illness Stigma	7.71	2.94	6.28	3.25	94	.96, 1.90	.73***	6.04***	93

Note: \*\*\* $p < .001$

$H_6$  : *There is a significant decrease in the level of stereotype endorsement before and after attending the workshop.*

A paired-sample t-test was conducted to determine the effect of brief mental health workshop on stereotype endorsement. As shown in Table 4.7, lower scores were shown after the mental health workshop ( $M = 2.70$ ,  $SD = 1.05$ ) than before the mental health workshop ( $M = 3.41$ ,  $SD = .95$ ). The difference was .71, 95% CI [0.50, 0.92], was significant  $t(93) = 6.69$ ,  $p < .001$ , and indicated a medium effect size, Cohen's  $d = .71$ . Hence,  $H_6$  is supported.

Table 4.7

*Results of t-test and Descriptive Statistics for Stereotype Endorsement*

	Pretest		Posttest		<i>n</i>	95% CI for Mean Difference	<i>r</i>	<i>t</i>	<i>df</i>
	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>					
Stereotype Endorsement	3.4	.95	2.70	1.05	94	.50, .92	.47***	6.69***	93

Note: \*\*\* $p < .001$

$H_7$  : *There is a significant decrease in the level of desire for social distance before and after attending the workshop.*

A paired-sample t-test was conducted to determine the effect of brief mental health workshop on desire for social distance. The results as shown in Table 4.8, lower scores shown in the desire for social distance after the mental health workshop ( $M = 3.59$ ,  $SD = 2.57$ ) than before the mental health workshop ( $M = 4.27$ ,  $SD = 2.45$ ). The difference was .69, 95% CI [.31, 1.07], was significant  $t(93) = 3.58$ ,  $p = .001$ , and indicated a small effect size, Cohen's  $d = .27$ . Hence,  $H_7$  is supported.

Table 4.8

*Results of t-test and Descriptive Statistics for Desire for Social Distance*

	Pretest		Posttest		$n$	95% CI for Mean Difference	$r$	$t$	$df$
	$M$	$SD$	$M$	$SD$					
Desire for Social Distance	4.27	2.45	3.58	2.57	94	.31, 1.07	.73***	3.58***	93

Note: \*\*\* $p \leq .001$

**Attitudes Toward Seeking Professional Psychological Help (ATSPPH-SF)**

$H_8$  : *There is a significant increase in the level of help-seeking behaviour before and after attending the workshop.*

A paired-sample t-test was conducted to determine the effect of brief mental health workshop on help-seeking behaviour. On average, higher scores were shown in ATSPPH-SF after the mental health workshop ( $M = 15.46$ ,  $SD = 4.93$ ) than before the mental health workshop ( $M = 14.98$ ,  $SD = 5.22$ ). As shown in Table 4.9, there was no significant difference between pre- and post- test was shown. Hence,  $H_8$  is rejected.

Table 4.9

*Results of t-test and Descriptive Statistics for Help-seeking Behaviour*

	Pretest		Posttest		<i>n</i>	95% CI for Mean Difference	<i>r</i>	<i>t</i>	<i>df</i>
	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>

## Chapter 5 Discussion

### Introduction

The effects of brief mental health workshop on secondary school students have been determined in this study. Our study provided an evidence that a brief mental health workshop is viable to increase mental health literacy in the areas of mental health knowledge and mental illness stigma.

There is significant positive difference for the mental health knowledge and mental illness stigma for secondary school students upon the completion of workshop. This finding is in line with the study conducted by Perry et al. (2014) which stated results from RCT elicited significant positive outcomes for both mental health knowledge and stigma reduction but no significant changes on help-seeking behaviour was shown based on the HeadStrong programme.

All areas of mental illness stigma measured in our study are considered as perceived stigma which indicates the extensions of others perceive the individual with mental illness is socially undesirable (Gaebel et al., 2014).

In general, we found that despite the mental health knowledge increased and mental illness stigma decreased as the effects shown on a brief mental health workshop, however, the secondary school students might still insist to seek help whenever necessary.

### Gender Difference in Mental Health Knowledge

There was no significant gender difference in the mental health knowledge was shown in our study. Our findings are contradicted to past studies mentioned that generally female are having higher level of mental health knowledge as compared to their male counterparts (Tay, Tay, & Klainin-Yobas; 2018; Chong, et al., 2016). This can be explained by the general mental health knowledge of Malaysian are low, thus, it is difficult to draw a difference of this aspect by gender. Past study by Yeap and Low (2006) stated that majority of Malaysians did

not have adequate knowledge of mental health which hinder them to detect any early signs and symptoms of mental illness.

### **Gender Difference in Mental Illness Stigma**

The results of analysis show that there are significant gender differences for mental illness stigma which measured by questionnaire measuring mental illness stigma in which males were significantly higher in mental illness stigma as compared to females in both pretest and posttest. This is consistent with the study by Gaebel et al. (2014) which stated perceived stigma of males is relatively higher than females. In contrast, females found to have higher self-stigma in comparison to males which leads them to have higher likelihood to experience social withdrawal and discrimination (Khan, Kausar, Khalid, & Farooq, 2015). Even in a local study indicated that female adolescents are having higher susceptibility to the diagnosis of mental disorders as compared to their male counterparts (Yaacoob et al., 2009). This finding could add an explanation to Khan, Kausar, Khalid, and Farooq (2015) which mentioned males are higher in perceived stigma whereas females are higher in self-stigma.

There is no significant gender difference in stereotype endorsement is shown in our study. This is different from the study by Khan et al. (2015) which depicted a result of males are relatively higher in stereotype endorsement as compared to females. Our sample size might not be sufficient to draw a difference in mental illness stigma especially in stereotype endorsement.

Moreover, the gender difference in desire for social distance towards people with mental health issue is shown in the pre-test. Our results show males were significantly higher in desire for social distance towards people with mental health issue as compared their female counterparts. This is contradicted to the study by Jorm and Oh (2009) which stated that there is no significant gender difference in terms of desire for social distance from individuals with mental disorders. Gender is not the only plausible factors that influence an individual's

desired social distance from people with mental illness. Past studies mentioned that stigma is a multidimensional concept which can be varied across factors such as age, gender and culture (Griffiths, Christensen, & Jorm, 2008; Watson, Miller, & Lyons, 2005; Fogel, & Ford, 2005).

### **Gender Difference in Help-seeking Behaviour**

There was no significant gender difference in the help-seeking behaviour was shown in our study. As mentioned in Tay, Tay, and Klainin-Yobas (2018) females are especially higher in help-seeking behaviour as compared to their male counterparts in help-seeking from both formal and informal helper who preferred coping alone. Besides, males are very likely to delay the action of seeking-help from mental health professionals (Chong et al., 2016). However, our study shows contradictions as compared to these past findings. Part of the reasons for this condition might because our general findings show no significant difference in the help-seeking behaviour and our sample is not large enough to elicit both effects in help-seeking behaviour as well as gender difference in this aspect.

### **Effects on Mental Health Knowledge**

The study discovered that there was a significant difference in the mental health knowledge on the secondary school students after attending the mental health workshop. This is in line with past studies which shown mental health educational programme or workshop for adolescents can elicit the improvement in their mental health knowledge (Pinfold & Stuart, 2003; Chan et al., 2009; Naylor et al., 2009). Our study indicates that even in Malaysia which is a collectivist, multiracial, and multicultural society which is different society settings compared to past studies carried at Western society (Naylor, Cowie, Walters, Talamelli, & Dawkins, 2009; Essler, Arthur & Stickley, 2006), however, the positive effects on mental health knowledge in the aspect is shown after attending the workshop.

**Effects on Mental Illness Stigma**

Our findings indicated that there was a significant difference in the mental illness stigma on the secondary school students after attending the mental health workshop. This finding is in line with Pinfold (2003) and Pinfold et al. (2005) and Essler et al. (2006). According to a local study by Nik Mustafa (2015) described that stigma and discrimination are viable to be a major barrier that discourages youth with mental illness and their families from seeking help and necessary treatment. Hence, through the reduction in mental illness, the students might not immediately elicit improvement in help-seeking behaviour, however, they might increase likeliness to seek help whenever in need in the near future.

**Effects on Stereotype Endorsement**

The study discovered that there was a significant difference in the stereotype endorsement on the secondary school students after attending the mental health workshop. Stereotype endorsement shown a significant decrease after the students attending the 50 minutes brief mental health workshop. This is contradicted to the findings by Ke et al. (2016) which stated there was no significant difference in the stereotype endorsement on the secondary school students after a one-hour brief mental health workshop. Ke et al. (2016) which stated duration of mental health workshop might shows a linkage to the effectiveness. Hence, the contrast between our study and past findings might be influenced by other factors such as content of the workshop material, teaching style and even the cultural background of the students.

**Effects on Desire for Social Distance**

The study discovered that there was a significant difference in the desire for social distance on the secondary school students after attending the mental health workshop. This finding is in line with Ke et al. (2016) which show a brief mental health workshop could decrease the students' desire for social distance with people with mental illness. The decrease

in desire for social distance could increase the friendliness of the students toward the people with mental illness and more likely to engage with them. This indirectly can reduce the social withdrawal and discrimination experience by people with mental illness (Khan, Kausar, Khalid, & Farooq, 2015).

### **Effects on Help-seeking Behaviour**

Our findings discovered that there was no significant difference in the help-seeking behaviour from mental health professions before and after the mental health workshop. This result is contradicted with the findings of Nik Mustafa et al. (2015) which described stigma and discrimination are viable to be the main hindrance that discourages adolescence with mental health issue and their families from seeking necessary help. In our study even though positive results shown in both the mental illness stigma which includes both stereotype endorsement and desire for social distance, and mental health knowledge, however, the students' help-seeking attitude towards mental health is still cannot be improved through a brief workshop.

Phang, Marhani, and Salina (2010) mentioned that individuals with mental health issues in Malaysia frequently choose to seek help from traditional healers as their priority rather than mental health professionals. They also stated more than half of their respondents indicated that they had sought help from traditional healers for at least once. Angermeyer and Dietrich (2006) stated that how individuals define a mental health issue, and their perception of cause and the prognosis expectations are factors that influence the help-seeking behaviour. Besides, the fear of being stigmatized by peer is one of the major barriers for an adolescent to seek mental health treatment rather than an illiteracy of the feasible resources (Zhao et al., 2015). Thus, some adolescents might not have high mental illness stigma but individually may have the fear of being stigmatized, prior to seek help from traditional healers, false

perception of cause, and poor prognosis expectations which could be the causes that inhibit the improvement in help-seeking behaviour.

### **Implications**

The findings of our study demonstrated that a brief mental health workshop is viable to have effectiveness on improving mental health knowledge and reducing mental illness stigma, despite there was no significant difference between the pre- and post- test in help seeking behaviour, perhaps we should have more study on brief mental health workshop by emphasizing the content on help seeking behaviour. Ke et al. (2015) mentioned that there was a reduction of more than one-third in stigma subscale of desire for social distance immediately after a brief mental health workshop. In comparison, our findings show only a slight reduction for less than one-fifth in the particular subscale. Perhaps, we should make improvements by involve audience engagement activities such as discussion that ask the audience to reflect on their own feelings and experiences that practiced by Ke et al. (2015). Besides, a gender difference in mental illness stigma was found in our study. This study fills the knowledge gap on providing evidence to increase mental health literacy in Malaysia context which our current mental health literacy is comparative low to other countries (Yeap and Low, 2009).

### **Limitations**

There are several limitations throughout the whole research study that more or less affect the research outcomes. First, it is the time constraint for the preparation and the duration of the workshop. Part of the reasons is because the time allocated for us to carry out the workshop is partly depending on the school arrangement. Although our findings shown positive outcomes for some dependent variables, however, the question of how long the effects of the mental health workshop last is still remain unanswered. For instance, follow up of assessment ranging from after one-month to years were conducted in previous studies (Ke

et al., 2015; Yamaguchi et al., 2011; Perry et al., 2014). Second, the participants were in their peak season in preparing of their final exam, to certain extend this might affect their attention to be able to concentrate on the workshop. In regard to this, students who have high involvement can lead them to pay more attention, improve reasoning, capable to recall content from previous classes and so forth (Caldwell, 2007). Third, we realised that the adopted questionnaire is somehow difficult to comprehend for the secondary school students even though there were past studies apply it on the same age group. Ting, Marzuki, Chuah, Misieng, and Jerome (2017) mentioned that Malaysians were lack of English proficiency even for university graduates which triggered high unemployment rate.

### **Recommendations for Future Research**

Future studies are recommended to conduct similar study in a longitudinal study design which follows the same sample of individuals over time to answer the question of how long can the effects of mental health workshop last like what had been carried out in previous studies (Ke et al., 2015; Naylor et al., 2009; Hoven et al., 2008). Besides, even though a mental health workshop with duration of around an hour can have some positive effects, however, the help-seeking behaviour still remain unchanged. In regard to this, a mental health workshop that provide a contact condition to participants to have contact with individuals with mental health problems could improve the help-seeking behaviour (Yamaguchi et al., 2009). Thus, future studies can provide an opportunity to participants to listen some personal experiences from people with mental illness. Moreover, due to the Malaysian context is different from the western context for its complex multiracial and multicultural society, and there is lacking of mental health resources in providing adequate mental health services (Chong, Mohamad, & Er, 2013), in regard to current location of study, there is no full time psychiatrist and psychologist in the town which hinders the accessibility of mental health services. Furthermore, we assume those existing mental health assessments that crafted in

western context may not possess with the same validity when apply in Malaysia, the future researchers are highly recommended to reword, rephrase, or translate mental health assessments with back-translation in order to fulfil the need in Malaysia. As stated in Yeap and Low (2009), the help-seeking behaviour can be influenced by factors such as personal attitudes, ethnicity, and age, particularly the ethnicity could influence individuals' decisions to seek help. Hence, future studies are suggested to test on mental health workshop in a multiracial setting that involves comparable number of participants of different ethnicities.

### **Conclusion**

This research aimed to examine the effectiveness of brief mental health workshop on mental health literacy in the areas of mental health knowledge, mental illness stigma, and help-seeking behaviour from mental health professionals among the secondary school students in Malaysia. This study was conducted in a quasi-experimental pre-post design study with the participation of 94 secondary school students which they were recruited based on purposive sampling method. This study shown that a 50 minutes brief mental health workshop is viable to increase mental health literacy particularly in mental health knowledge improvement and mental illness stigma reduction in terms of stereotype endorsement and desired social distance, however, no significant difference was shown in help-seeking behaviour. This study provides evidence that a brief mental health workshop can elicit positive impacts in mental health literacy on Malaysian adolescents which born in a multiracial and multicultural context. Hence, more mental health workshop can be carried out to target on adolescents in Malaysia to cultivate prevention or encouragement of early intervention. Lastly, future studies can extent the study on other mental health workshops that potentially improve the effect on help-seeking behaviour.

Re: U/SERC/15/2019

8 February 2019

Dr Chie Qiu Ting  
 Head, Department of Psychology and Counselling  
 Faculty of Arts and Social Science  
 Universiti Tunku Abdul Rahman  
 Jalan Universiti, Bandar Baru Barat  
 31900 Kampar, Perak.

Dear Dr Chie,

**Ethical Approval For Research Project/Protocol**

We refer to the application for ethical approval for your students' research projects from Bachelor of Social Science (Hons) Psychology programme enrolled in course UAPZ3023. We are pleased to inform you that the application has been approved under expedited review.

The details of the research projects are as follows:

	Research Title	Student's Name	Supervisor's Name	Approval Validity
1.	Know It Now: The Effects of Brief Mental Health Workshop on Secondary School Students	1. Tan Sin Yee 2. Phang Jin Xiang	Mr Tay Kok Wai	8 February 2019 – 7 February 2020

The conduct of this research is subject to the following:

- (1) The participants' informed consent be obtained prior to the commencement of the research;
- (2) Confidentiality of participants' personal data must be maintained; and
- (3) Compliance with procedures set out in related policies of UTAR such as the UTAR Research Ethics and Code of Conduct, Code of Practice for Research Involving Humans and other related policies/guidelines.

Should the students collect personal data of participants in their studies, please have the participants sign the attached Personal Data Protection Statement for records.

Thank you.

Yours sincerely,

**Professor Ts Dr Faidz bin Abd Rahman**  
Chairman  
UTAR Scientific and Ethical Review Committee

c.c    Dean, Faculty of Arts and Social Science  
        Director, Institute of Postgraduate Studies and Research

**解释声明**

我们是来自金宝拉曼大学，艺术与社会科学学院，社会科学学士（HONS）心理学系本科生。我们正在进行一份名为**心理健康工作坊是否能有效地提高心理健康素养**的毕业论文。

以下将详细说明此研究的相关事宜。

**研究目的**

透过进行此心理健康工作坊以了解此工作坊是否能改善马来西亚中学生与心理健康知识，精神疾病偏见及健康寻求行为

**研究涉及**

此问卷包含四个部分，分别为个人资料，心理健康知识，心理疾病偏见和精神疾病患者的求助行为。此调查需大约 10-15 分钟完成。

**参与与风险**

此研究不涉及任何风险。您的参与属自愿模式，您可以选择随时停止或撤销，也可跳过任何您不愿意或无法回答的问题。您将不会被逼参加，同时，如果选择不参加也不会受到任何处分。但是，如果您完成所有问卷，则代表您同意将您提供的信息纳入研究。

**保密事宜**

您所给予的所有信息都将保密。唯有研究人员才能使用研究资料。该调查问卷仅用于学术用途。此外，参与者的信息亦不会在其他社区小组中公开使用，或用于其他用途。

**道德标准**

这项研究涉及到实验对象的参与以及个人资料的收集。因此，此研究项目已经通过 UTAR Scientific and Ethical Review Committee (SERC) 的审查以及获得批准，参考编号为：U/SERC/15/2019

**福利与补偿**

此项研究并未给予任何福利及补偿。但是，您的参与将为我们的研究带来更好的理解此工作坊是否能提高心理健康素养方面的有效性。

**联络方式**

研究人员非常乐意回答所有关于此研究的操作程序。如果您有任何关于此研究项目的问题及疑问，可通过发送电子邮件至 [tsyxy1001@1utar.my](mailto:tsyxy1001@1utar.my)。

## Appendix C

Jaden Tan &lt;tsyxy1001@gmail.com&gt;

---

**Request: Permission to Adapt Modules from TeenMentalHealth.org in Malaysia**

---

Kutcher, Stanley &lt;Stanley.Kutcher@iwk.nshealth.ca&gt;

Fri, Jan 25, 2019 at 6:17 AM

To: Kok Wai Tay &lt;taykw@utar.edu.my&gt;

Cc: Jaden Tan Sin Yee &lt;tsyxy1001@gmail.com&gt;, Marcus Phang &lt;marcusphangjx@gmail.com&gt;, "Wei, Yifeng" &lt;Yifeng.Wei@iwk.nshealth.ca&gt;, Lori Roe &lt;Lori.Roe@albertahealthservices.ca&gt;, "MacKay, Amy" &lt;Amy.MacKay@iwk.nshealth.ca&gt;

Thanks all. Appreciate the clarity of your note and the helpful attachment.

A number of comments.

You may want to use the MHL test package that Dr. Wei has created and that we have used in a number of publications for a baseline measure – so that you can write a paper on the baseline MHL of your students using validated tools and that would be a simple publication and one that would make a contribution to the field.

You may want to modify the knowledge test that we used in a number of publications to make sure that the questions asked are covered in your adapted materials and use that as your post test measure. Then you will have an appropriate measure of MHL.knowledge. You can still use the rest of the MHL test package for your post-test assessment.

You may want to do a 3 month followup assessment.

I suggest that you contact Dr. Wei to ask her permission to use the evaluation package – I have copied her here. She can be an invaluable resource for you and can help author any publications that you want to create and submit.

The adaptations seem reasonable to me. You have my permission to go ahead as per your plan.

Once you have completed the adaptation, please send it to us (include Dr. Wei and Dr. Roe – see above) and we will consider posting it on our website as the Malaysian version with your inputs acknowledged. That will allow you to use the resource more widely in the future and will bring people who are interested in partnering you.

We would also like to see the results of your research – please ensure that you have proper ethics approval before starting.

Lori Roe will be taking over as the key person to contact regarding these matters in the next few months. Please copy her on all correspondence.

All the best

Professor Kutcher

## Appendix D

**DEMOGRAPHIC SHEET**

**Please circle whatever circle choose**

1. Student ID:
2. Gender: Male / Female
3. Race: Malay / Chinese / Indian / Others
4. Age: \_\_\_\_\_
5. Stream of study: \_\_\_\_\_
6. Do you have any personal experience of mental illness or someone close to you (e.g. friend, family member, classmate, and etc.) experienced with mental illness?  
Yes / No

**GENERAL HEALTH QUESTIONNAIRE – 28**  
**(David Goldberg and Hiller, 1979)**

Please read this carefully.

We should like to know if you had any medical complaints, and how your health has been in general, over the past few weeks. Please answer ALL the questions on the following pages simply by underlining the answer, which you think most nearly, applies to you. Remember that we want to know about present and recent complaints, not those that you had in the past. It is important that you try to answer ALL the questions.

Thank you very much for your co-operation.

**HAVE YOU RECENTLY:**

A1-been feeling perfectly well and in good health?	Better than usual	Same as usual	Worse than usual	Much worse than usual
A2-been feeling in need of a good tonic?	Not at all	No more than usual	Rather more than usual	Much more than usual
A3-been feeling run down and out of sorts?	Not at all	No more than usual	Rather more than usual	Much more than usual
A4-felt that you are ill?	Not at all	No more than usual	Rather more than usual	Much more than usual
A5-been getting any pains in your head?	Not at all	No more than usual	Rather more than usual	Much more than usual
A6-been getting a feeling of Tightness or pressure in your head	Not at all	No more than usual	Rather more than usual	Much more than usual
A7-been having hot or cold spells?	Not at all	No more than usual	Rather more than usual	Much more than usual
B1-lost much sleep over worry?	Not at all	No more than usual	Rather more than usual	Much more than usual
B2-had difficulty in staying asleep once you are off?	Not at all	No more than usual	Rather more than usual	Much more than usual
B3-felt constantly under strain?	Not at all	No more than usual	Rather more than usual	Much more than usual
B4-been getting edgy and bad-tempered?	Not at all	No more than usual	Rather more than usual	Much more than usual
B5-been getting scared or panicky for no good	Not at all	No more than usual	Rather more than	Much more than usual

reason?			usual	
B6-found everything getting on top of you?	Not at all	No more than usual	Rather more than usual	Much more than usual
B7-been feeling nervous and strung-up all the time?	Not at all	No more than usual	Rather more than usual	Much more than usual
C1-been managing to keep yourself busy and occupied?	More so than usual	Same as usual	Rather less than usual	Much less than usual
C2-been taking longer over the things you do?	Quicker than usual	Same as usual	Longer than usual	Much longer than usual
C3-felt on the whole you were doing things well?	Better than usual	About the same	Less well than usual	Much less well
C4-been satisfied with the way you've carried out your task?	More satisfied	About same as usual	Less satisfied than usual	Much less satisfied
C5-felt that you are playing a useful part in things?	More so than usual	Same as usual	Less useful than usual	Much less useful
C6-felt capable of making decisions about things?	More so than usual	Same as usual	Less so than usual	Much less capable
C7-been able to enjoy your normal day-to-day activities?	More so than usual	Same as usual	Less so than usual	Much more than usual
D1-been thinking of yourself as a worthless person?	Not at all	No more than usual	Rather more than usual	Much more than usual
D2-felt that life is entirely hopeless?	Not at all	No more than usual	Rather more than usual	Much more than usual
D3-felt that life isn't worth living?	Not at all	No more than usual	Rather more than usual	Much more than usual
D4-thought of the possibility that you might make away with yourself?	Definitely not	I don't think so	Has crossed my mind	Definitely have
D5-found at times you couldn't do anything because your nerves were too bad?	Not at all	No more than usual	Rather more than usual	Much more than usual
D6-found yourself wishing you were dead and away from it all?	Not at all	No more than usual	Rather more than usual	Much more than usual
D7-found that the ideas of taking your own life kept coming into your mind?	Definitely not	I don't think so	Has crossed my mind	Definitely has

**Mental health knowledge schedule** **MAKS**

**Instructions:** For each of statements 1–6 below, respond by ticking one box only. Mental health problems here refer, for example, to conditions for which an individual would be seen by healthcare staff.

		Agree strongly	Agree slightly	Neither agree nor disagree	Disagree strongly	Disagree slightly	Don't know
1	Most people with mental health problems want to have paid employment.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2	If a friend had a mental health problem, I know what advice to give them to get professional help.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3	Medication can be an effective treatment for people with mental health problems.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4	Psychotherapy (eg talking therapy or counselling) can be an effective treatment for people with mental health problems.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5	People with severe mental health problems can fully recover.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6	Most people with mental health problems go to a healthcare professional to get help.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

**Instructions:** Say whether you think each condition is a type of mental illness by ticking one box only.

7	Depression	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8	Stress	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9	Schizophrenia	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
10	Bipolar disorder (manic-depression)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
11	Drug addiction	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
12	Grief	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

**Thank you very much for your help.**

Questionnaire measuring mental illness stigma (including stereotype endorsement and desire for social distance) adopted from Ke et al. (2015).

	Agree	Disagree	Unsure
1. Someone who has a mental illness cannot cope with stress before exams.			
2. Mostly, someone who has a mental illness comes from a family with little money.			
3. Someone who has a mental illness cannot be helped by doctors.			
4. When meeting someone with a mental illness, one should better watch out.			
5. Someone who has a mental illness can be good at school.			
6. Someone who has a mental illness blows his/her top for the slightest reason.			
7. Students who have a mental illness are particularly good at music or art.			
8. I would be afraid to talk to someone who has a mental illness.			
9. I would not be upset or disturbed to be in the same class with someone who has a mental illness.			
10. I could imagine making friends with someone who has a mental illness.			
11. I would feel embarrassed or ashamed if my friends knew that someone in my family has a mental illness.			
12. If the person sitting next to me in class develops a mental illness, I would rather sit somewhere else.			
13. If one of my friends developed a mental illness, I would go and see him/her at the hospital.			
14. I would not invite someone who has a mental illness to my birthday party.			
15. I would not bring along someone who has a mental illness when I meet my friends.			
16. When going on a class outing, someone with a mental illness should rather stay at home.			
17. I would never fall in love with someone who has a mental illness.			
18. Someone who has a mental illness should not work in jobs that involve taking care of children or young people.			
19. Someone who has a mental illness should not go to a regular school.			

### Attitudes Toward Seeking Professional Help

Your sex: \_\_\_\_\_ Male \_\_\_\_\_ Female  
 Your race/ethnicity: \_\_\_\_\_ African American  
 \_\_\_\_\_ Asian/Asian American  
 \_\_\_\_\_ White/European American  
 \_\_\_\_\_ Latino/a  
 \_\_\_\_\_ Arab/Middle Eastern  
 \_\_\_\_\_ Other: Please specify \_\_\_\_\_

#### Instructions

Read each statement carefully and indicate your degree of agreement using the scale below. In responding, please be completely candid.

0 = Disagree      1 = Partly disagree      2 = Partly agree      3 = Agree

- \_\_\_\_\_ 1. If I believed I was having a mental breakdown, my first inclination would be to get professional attention.
- \_\_\_\_\_ 2. The idea of talking about problems with a psychologist strikes me as a poor way to get rid of emotional conflicts.
- \_\_\_\_\_ 3. If I were experiencing a serious emotional crisis at this point in my life, I would be confident that I could find relief in psychotherapy.
- \_\_\_\_\_ 4. There is something admirable in the attitude of a person who is willing to cope with his or her conflicts and fears without resorting to professional help.
- \_\_\_\_\_ 5. I would want to get psychological help if I were worried or upset for a long period of time.
- \_\_\_\_\_ 6. I might want to have psychological counseling in the future.
- \_\_\_\_\_ 7. A person with an emotional problem is not likely to solve it alone; he or she is likely to solve it with professional help.
- \_\_\_\_\_ 8. Considering the time and expense involved in psychotherapy, it would have doubtful value for a person like me.
- \_\_\_\_\_ 9. A person should work out his or her own problems; getting psychological counseling would be a last resort.
- \_\_\_\_\_ 10. Personal and emotional troubles, like many things, tend to work out by themselves.

#### Scoring

Reverse score items 2, 4, 8, 9, and 10, then add up the ratings to get a sum. Higher scores indicate more positive attitudes towards seeking professional help. Calculate a mean for males, for females, and for each of the ethnic groups to examine group differences. Discuss any observed similarities and/or differences between the groups with the class.

Appendix E

### MYTHS AND FACTS 迷思与真相

- Mental illnesses are caused by witchcraft, spells or possession by demons. ✘
- 心理疾病是巫术、咒语或魔鬼附体引起的。✘
- Mental illnesses are not caused by spirits, witches or demons. ✔
- 心理疾病不是由幽灵、巫术或魔鬼引起的。✔
- Mental illnesses are the result of disturbances in usual brain function that lead to difficulties with the control of feelings, thinking and behaviors. ✔
- 心理疾病是正常大脑功能紊乱的结果，这导致情绪、思维和行为难以控制。✔

### MYTHS ABOUT PEOPLE AND THEIR FACTS 关于人的迷思与其真相 (二)

- People with a mental illness cannot achieve anything
- 患有心理疾病的人什么也做不了。
- Sometimes a mental illness can make it difficult for a person to work (same as a physical illness), but with proper treatment a person with a mental illness can work very well. Some of the world's greatest achievers have had a mental illness.
- 有时候心理疾病会使人难以工作（就像身体的疾病一样），但经过适当的治疗，心理疾病患者可以工作得很好。世界上有一些伟大的成功人士都患有心理疾病。

### MENTAL DISORDER 心理疾病

- The brain is not functioning as it is supposed to function, leading to significant and persistent problems in a person's everyday life (caused by a combination of genetic and environmental factors).
- 大脑并没有正常运转，这就导致了人们日常生活中一些重大而持久的问题（由基因和环境因素共同导致）。
- Happens to about 20% of people over their lifetime.
- 大约20%的人一生中都会遇到这种情况。
- Must be diagnosed by a properly trained health professional.
- 必须由经过适当培训的卫生专业人员诊断。
- Requires scientifically valid treatments provided by a trained health professional.
- 需要由训练有素的卫生专业人员提供科学有效的治疗。

### BRAIN AND BODY 大脑与身体

- Life Stress –such as a viral infection.
- 生活压力：比如病毒感染。
- Body responds with increasing temperature (e.g. fever) and negative physical sensations (e.g. aching muscles, fatigue).
- 身体会出现体温升高(如发烧)和身体负性感觉(如肌肉酸痛、疲劳)的反应。
- Your immune system fights off the virus and now you are stronger in case it comes back
- 当你的免疫系统击退了病毒，你便变得更强壮，以防病毒卷土重来。

### REMEMBER ... 我们需要知道。。。。

- You cannot separate the Brain from the Body. The Brain and Body are one!
- 你不能将大脑与身体区分。大脑和身体是一体的!
- So, it's also not possible to separate Mental from Physical Health –what is good for your brain will be good for your body, and vice versa.
- 所以，也不可能把心理健康和身体健康区分，对你的大脑有好处的东西也会对你的身体有好处，反之亦然。

### DEPRESSION 抑郁症

- Depression is not the same as feeling depressed.
- 抑郁症和感觉抑郁是不一样的。
- Depression is characterized by **persistent and sustained**: depressed mood, loss of interest, guilty ruminations, feelings of hopelessness/worthlessness, fatigue, concentration problems, loss of appetite, loss of pleasure, suicidal thoughts/actions.
- 抑郁的特征是持续的:情绪低落,失去兴趣,内疚的沉思,绝望/没有价值的感觉,疲劳,注意力集中的问题,食欲不振,失去快乐,自杀的念头/行为。
- Depression leads to many problems in everyday life and affects about 4-6% of teens
- 抑郁症在日常生活中会导致很多问题,大约有4-6%的青少年受到抑郁症的影响。

### TREATMENTS FOR MOOD DISORDERS 情感性疾病的的治疗方法

- Effective treatments for mood disorders are available.
- 对治疗情感性疾病有效的疗法是存在的。
- For Depression, a combination of a psychotherapy (usually Cognitive Behavior Therapy: CBT) and an antidepressant medication (usually an SSRI) is used.
- 对于抑郁症,采用心理疗法(通常是认知行为疗法:CBT)和抗抑郁药物(通常是SSRI)的结合。
- For Bipolar Disorder medications (such as lithium or other medications), psychotherapy and other treatments are used.
- 治疗躁郁症可以采用药物(比如锂或其他药物),心理治疗和其他治疗的结合。

### OTHER MENTAL ILLNESS IN YOUTH 青少年的其他心理疾病

- There are many different kinds of mental illnesses
- 心理疾病有很多种
- Many are rare or do not occur in teenagers (such as Dementia)
- 许多是罕见的或不发生在青少年身上(例如老人痴呆)
- Two that may occur in teenagers are: Obsessive Compulsive Disorder and Post Traumatic Stress Disorder
- 青少年中可能出现的两种是:强迫症和创伤后应激症

### UNDERSTANDING TREATMENTS 理解治疗的类别

- **Standard treatment** –based on a substantial amount of scientific evidence of effectiveness and safety.
- 标准治疗-基于大量的有效性和安全性的科学证据。
- **Alternative treatment** –insufficient scientific evidence of effectiveness and safety and used instead of standard treatment.
- 替代治疗-缺乏有效性和安全性的科学证据,并被用于替代标准治疗。
- **Complementary treatment** –often without the scientific evidence needed to be considered a standard treatment and given in addition to a standard treatment to help it work better or to focus on an additional health benefit.
- 补充治疗-通常没有必要的科学证据将其视为标准治疗,并在标准治疗之外给予辅助治疗,以帮助其更好地发挥作用或侧重于额外的健康益处。

### WHAT YOU NEED TO KNOW – PART 1 你需要知道的事 (一)

- People who have a mental illness have a brain disorder that can be treated.
- 患有脑部疾病的人患上了心理疾病是可以医治的。
- They are no different than you or your friend (indeed they may be you or your friend).
- 他们和你或你的朋友没有什么不同(事实上他们可能是你或你的朋友)。
- If a person has a mental disorder, the sooner a proper treatment can be provided, the better the chance of a good outcome.
- 如果一个人患有心理障碍,越早得到适当的治疗,结果就越好。
- You and your friends can help by:
- 你和你的朋友可以帮助:
  1. Getting treatment if you need it 在有需要时寻求专业帮助
  2. Fighting stigma against mental illness! 打击对心理疾病的偏见!

### Clinical Psychologist 临床心理师

- Master in Clinical Psychology 临床心理师硕士学位
- Diagnosis 诊断
- Psychotherapy 心理治疗
