Date : _____

ACKNOWLEDGEMENTS

I would like to thank to my supervisor Dr Wong Pei Voon for guiding me during the work for project 1 and 2. Besides that, I would like to thank to my lecturer Mr. Su Lee Seng for helping me to finish my project plus also patiently taking his time to teach me every new thing during the working for this project. I also would like to thank to my family for giving me support and their love throughout the course.

ABSTRACT

This project is to establishing, improvement of Student Management System for primary school. This project helps in finding the data collection of student records in primary school, to improve on delivering student report and to improve the management of student records. The creation of this project is mainly to manage student records and up-to-date information about school reports and student reports. Student information system mainly deals with much kind of student details, such as student examination results, student attendance reports and teacher reports for students. The administration is mainly deal with registration of new student, updating school news, publishing student examination results, update student attendance and also giving out student reports if is good or bad. Other than managing student records, students' parents able keep on track of their children by looking through their progress in this system. The Web-based student management system help students' parent by keeping track of their children attendance so that their children will stay in school, keep track of their children examination result to know the improvement of their children or needed more help in studies, viewing their children report given by teacher to know what activities they done and knowing the update of the school news to know if it is important to follow. Besides that, the system do help teacher to do analysis of their student grade and helping them to do prediction for their future student grade.

Chapter 1

Introduction

1.1 Background Information

Student Management System is a management information system for education. Web-Based Student Management System is a website that allows school teacher or staff to input student information to improve school management. School staffs and teachers are able to directly access to all the aspects of a student's academic progress through secure website.

Web-based student management system or in other word school portal is the web-based system allow school staff or teacher to manage their user record to those user who enroll in the current school. The primary objective for web-based student management system is to allow the school user such as teacher, staff, student, parent or headmaster or headmistress to provide rich information about their school activities or details such as student performance, school news, user attendance, student grade, and more. Besides that, it also given the user to access easily through online by surfing internet and it allow accessibility in anytime and anywhere, in other words, it is call ubiquity.

The function going to add into the system that allow the staff and teacher to look at the status of the student information and details with info-graphic function that show the graph of the student activities and information. Such as attendant status by showing percentage and name for each student per class to inform the teacher their student attendance status and if the student have low attendance percent, the teacher able to send email to the student parent. The new function that are added into the system is linear regression to predict student grade. This function allowing teacher to do analysis on their student grade and also do prediction of their student future grade.

1.2 Problem statements.

The education system is constantly evolving by each year. Managing an education system does require planning and time management. Other than that, most of the technologies do improved to become efficiency of teachers to educate their students in many different ways. With the large amount of information that requires input with such little time, the time management becomes much more crucial.

Some of the primary schools do not acquire a student management system. If the primary school does not acquire student management system, students' parents may not able to track their children progress during school activities. Most of the school news announced during assembly time. By doing this, some of the students may forget or does not understand the school announcement due to of still in the process of learning. Other than that, the school teacher may handout the school news in written document for each student to show to their parents. This will waste the amount of paper and school resources by printing each document for each students and this may also harm the ecosystem by making more paper from trees.

Children prompt tell lies to their parents about their examination results and attendance during their school. Most of the primary school does handout the examination result to students but some of the students tend to make stories about their examination results to make their parents believe. Besides that, some of the educational portal have install the common features or function into their school portal such as attendance that allows teacher to input attendance of their student, grading that show average score of the student, insert and show school news and more. The school teacher or staff might require to find out more about their student information and records but with limited function provided through the educational portal, the school staff and teacher may not able to solve the situation or getting better idea of their current student. Here is some problem that occur in primary school education:

1. Student information may get lost due to using manual system.
2. Limited function provided from the system.

- a. Info-graphic not provided for user.
3. Physical documentation that contain important information may get lost.
4. The manual system unable to provide security.
5. Some school information unable to reach to their parent.
 - a. Examination Grade
 - b. Attendance
6. Most of the system does not acquire any analysis function such as prediction tool.

1.3 Project Scope

The main purpose for this system is intended to manage information of student such as, personal details, examination result, attendance, providing school news and more. When the project is completed, it will provide comprehensive web-based student information system for primary school. The systems are able to store and retrieve data, sort and more. Besides that, these system able students' parents to keep on track of their children every school progress. For example, providing examination results for every student. This will help most of students' parents to keep on track of their children progress in school to ensure their children do not get in trouble in school. Other than that, to provide school news for teachers and students' parents to keep them inform whenever there is important school news such as sport day, teacher day, public holiday and more. This will help the students' parents and teachers to prepare any necessary action in the future.

This project is develop to make improvement of school portal that allow the staff or the teacher to looks through the data analysis that contain detail of student performance plus the number student registration. Other than that, it allows staff to do customization of their school data such as adding, remove or update class, student, teacher, staff and news.

Besides that, the info-graphic function will help the teacher and staff to get inform the performance of the student and also provide detail with better understanding such as bar graph of number of student register in which year, attendant status for each student in each class and statistic of the student grade that allow to do forecasting using linear regression.

Lastly, info-graphic in spotted graph that show the prediction method that is linear regression to predict the final grade for student per class together with formula and predicted grade.

1.4 Project Objective

1.4.1 News Module

The news module allow the school user to view the latest news from the school portal that provided from the school staff. The school staff allow to insert school news with editing features such as changing font style, font color, insert picture, bullet point and more. By having this features for the school staff, those who does not acquire HTML knowledge able to edit news without using HTML format such as writing paragraph using <p>.

1.4.2 Attendance Module

The attendance module allow the teacher to insert and edit student attendance while the student able to check their attendance through using the school portal. The attendance function help the teacher to insert their student attendance depend on which class the teacher are in charge. Besides that, it has an added function to send an email sender or the SMTP is to send email to student parent from the school teacher whether decision from the school teacher if the student have low percentage of attendance.

1.4.3 Registration Module

The registration module allow the staff to register student, teacher and staff that enrolled to the school. The registration function allow the staff to insert details of the person such as student name, student parent detail and more.

1.4.4 Class Registration Module

The class registration module allow the staff to register student to their class plus register one of the teacher will take in charge of one of the class. Other than that, the school staff also allow to insert new class into the system.

BIS (Hons) Business Information Systems

1.4.5 Info Graphic Module

Info graphic allow the staff to look through statistic information such as bar graph that show the number of student register for each year.

1.4.6 Prediction

Prediction by using linear regression to allow teacher to predict the student future grade. The prediction system will show the teacher the predicted value together with the other variable and spotted graph.

1.5 Instrument of survey

Survey questions are going through online platform. For the purpose for this project, Google Form is going to be distributed to primary school teachers through the internet. Google Form has the support of survey questionnaire template and also ability to easily share the form on many online platforms.

1.6 Achieved

The system are able to successfully predict user grade by using linear regression with the relationship between Score and Study Time by using programming language .php.

Chapter 2

Literature Review

2.1 Web-Based Student Management System

According to Zhibing Liu (2010), web based student management system are design to replace most of the documentation paper records. It allows education institutes to maintain records of students easily and secure. The student management system helps in establishment and maintenance database and front-end application. It is convenient application and friendly interface that help provide student information. Most of the problems are able to be solving using online student information management system thus reducing paper work such as registration form.

2.2 Technology Improving

According to Kai Liang (2016), most of the technology grow and become advance in every second pass. The usage of electronic devices increase due to application for authorization has improved and it is convenience to use in many ways. When the technology improves, most of the previous model will start following up. This is when the increasing of school seeks to incorporate the Web-based information and communication technologies.

2.3 Comparison of Traditional Education to Computer Aided Education

Some of the primary school is still using the traditional education system. Most of the traditional way of education was paper, form and report. Other than that, if the administrator is working with teacher in specific area and if that area that needing of attention, these area will be documented in an evaluation as unsatisfactory and require plan for improvement. This action is taken is to find the effective way in helping student to behave. Computer aided education tools were made for better interactive and visual. This

allows emphasizing the effectiveness of the computer aided education by written down report and post through the database to allow other teacher to look through it (Wald & Losen, 2003).

2.4 Education Portal

Most of the technology initiatives has already been introduced to many schools that aim to help the teacher and student for teaching and studying. The role for the online portal is to assist the teacher, student and staff by maintaining the school database, access to school information plus teaching using technology-based content. Online portal are developed is to ensure every citizen particularly school students to allow them to grant access to quality education presented through the digital medium that is school portal. The design and implementation of the education portal are design to eliminate the usage of school paper records to save cost plus environment, (Kalmegh, 2016). If the school staff are require to check the student or teacher record from the paper records, it will be difficult for them to manage and track the record if they acquire thousands of records.

Every public school are require to have a school portal by the year of 2020 (Vision 2020) in order to produce knowledgeable and skilled workforce for Malaysia and most of the language teacher are ready for teaching and learning by using computer-based (RAZAK, 2004). Most of the educational portal are very accessible to anywhere and anytime with internet or in other term called ubiquity. According to Bram (2011), the number of usage of education portal grown significance portal in many country such as Glow in Scotland, Kennisnet in Holland, and the National Educational Portal in Kenya.

There are two ways that user able to utilizing the education portal as their supporting tools is either by retrieving information from the database or share knowledge and information to other user. The benefit of using the education portal for teacher or staff are allowing them to keep track of their school record and as for the teacher is the student records. However, teacher are able to share information through education portal to student as well

as to staff and teacher. According to Kankanhalli (2005), sharing information through education portal or school portal do help to leverage the knowledge resource to the school user is a key form of which are electronic knowledge repositories (EKRs). This help to prevent knowledge drain or in other word loss of knowledge from the other user.

2.5 Information graphics or infographic

Information graphic (infographic) usually used to convert text into high-level intended message such as bar chart, pie chart, line graph and more. Besides that, infographic consist of multiple color to represent each content or point to ensure not clash with other information and making confusion to user if it only represent one color. The infographic is great to present to the reader for better absorption of knowledge and information quickly by looking through the graphic, this is because “picture is worth thousands of words” plus containing multitude of information (Zhuo Li, 2015).

The infographic able to use query to get the information that needed and present using graphic and text. As for the web-based student management system, we able to use SQL query to get the information from the database and convert into graphical and text form. But it was depend on what kind graph or chart does the user require such as, using bar graph require two relationship that is x-axis and y-axis to present a data like student name for x-axis and the percentage of attendance for the y-axis.

2.6 Linear Regression as Predictive model

Majority of school have occupied numbers of student and sometime teacher may have hard time knowing which student are having trouble with their studies. Usually teacher determine student understanding by looking through their student grade for each different year of student such as English Language grade for year 4, Mathematic grade year 2 and more. Besides that, teacher may conduct test to their student ensure their student are

improving their education but with the large number of student at school, it is impossible for teacher to go through each grade and keep track of the each student performance.

The predicting method for student learning performance in advance able to help the student and their teacher to keep track of student progress. One of the prediction method that is called linear regression able to help to predict the grade of final examination in particular subject (Patel, 2017). According to Patel (2017), there are many prediction method such as linear regression, ANN and decision tree but linear regression model is the best method to predict the future value for predicting final grade examination.

Each of prediction model are useful but is depend on what scenario. The decision tree are usually suit for large amount of data due to it allow to divide data into small sub-spaces to allow user to capture better division. ANN model able to learn, complex relationship and non-linear. The ANN model able to inter with many unseen relationship plus data to allow user make prediction on unseen data. The simple linear regression usually predicting performance, risk parameter and more. But usually this model use for analyze small amount of data and it is suit for this system due to each of school classes has small amount of student data that consist of 30 to 50 students to make prediction of student grade.

2.7 Predicting relationship between study time and grade.

There are some researcher explain that the length of study time do affect student academic by differentiate the short duration of study time and long duration of study time. Professor Palm Beach of the University of California in year 1864 do explain that study time is the best tool for predicting. Both study time and grade has their strong relationship and able to predict their academic performance (George, 2013). Besides that, some of the researcher do point out that relationship between student study hours with grade point has the weak or unreliable to do prediction due to the prediction may not be clear (Howard Schuman, 1985). The prediction between relationship of study time and grade may not be good but it still allow user to use this prediction if they find it useful (E. Ashby Plant*, 2005).

Chapter 4

Proposed Method/Approach

4.1 Methodology

For this web-based student management system development process, the agile development methodology under extreme programming is the best approach or suit for web-based development. This is because agile development allow to improve the quality of application if there is anything wrong or mismatch the requirement of the application. But the disadvantage of this approach is the probability of getting off-track.

Extreme programming are suit for small project such as website development and does not require large group to develop the system. Comparing with waterfall model process, the process for building the system able to save a lot of time due to is easy to understand plus easy testing and analysis. The waterfall model usually use for large scale project with lots of planning phase before begin development. The disadvantage for waterfall model is that they unable to move back after they done one of the phase and it takes longer period to finish.

4.1.1 Planning Phase

Sending out survey plus interview some teacher to get the understanding plus idea of how the school portal work in primary school. During the interview session, the question will be prepare for interviewer plus voice recording. The voice recording are use because to avoid miss heard any sentences during interview. The survey are send out through internet by using google form. After that, analysis will be study from the survey answer result.

4.1.2 Analysis Phase

BIS (Hons) Business Information Systems

Faculty of Information and Communication Technology (Kampar Campus), UTAR 17

Analysis the survey answer plus the interview answer to get clear understanding of how the system work. After that, the requirement to improve will list out of what should improve and which new feature and function will be added. Other than that, going through journal and article to get extra information about the existing project for further understanding plus comparing the existing systems.

4.1.3 Design Phase

In the design phase, the backend coding will begin before the designing the user interface for the web-based student management system. As for UI design, HTML and CSS template will be used for the system with few changes. Other than that, database will implement into the system to store data by using mysql format.

4.1.4 Testing Phase

Alpha testing will take place after for each part of system that has been complete.

4.1.5 Delivery Phase

As for the delivery phase, we might able to send through by softcopy in CD together with SQL, website file (.php) and document.

4.2 Online Survey

Online survey has send out to the teacher that work in primary and secondary school in order to get information of what should be provided for school portal. Furthermore, an interview to one of the primary school teacher that work in S.J.K. (C) Keng Koon primary

school that located in Penang. The figure below shows the online survey with the number participant that answer the online survey with pie chart percentage.

Does your school have a Web-Based Student Management System ?

2 responses

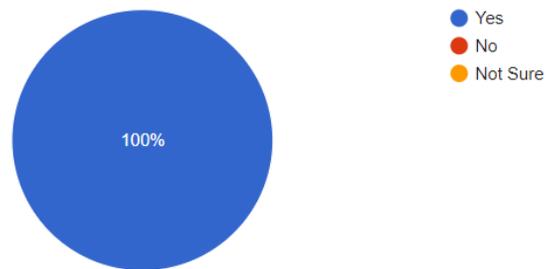

Figure 4.1 Online survey Question 1 Respondent

Does having a Web-Based Student Management System a good option for all primary schools ?

2 responses

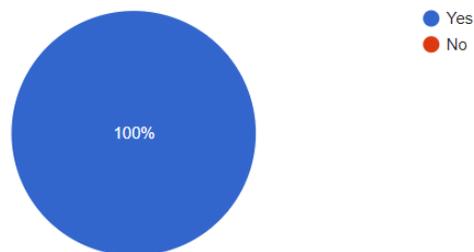

Figure 4.2 Online survey Question 2 Respondent

Which option do you prefer in the Web-Based Student Management System ? Having..

2 responses

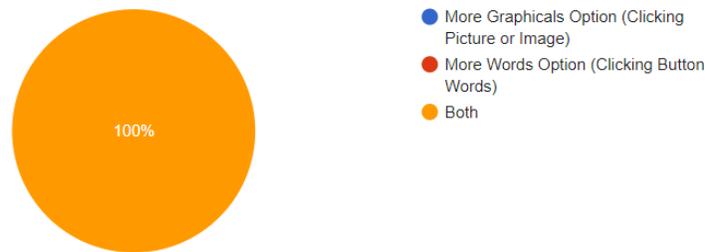

Figure 4.3 Online survey Question 3 Respondent

Does publishing school news through Web-Based keep the students, parents and teachers well informed ?

2 responses

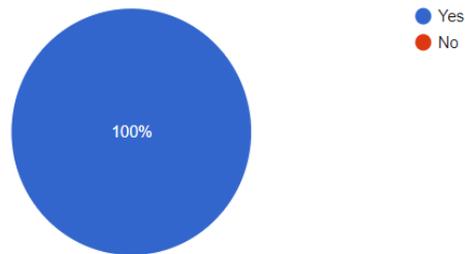

Figure 4.4 Online survey Question 4 Respondent

Does giving out timetable to students through Web-Based help keep them on track ?

2 responses

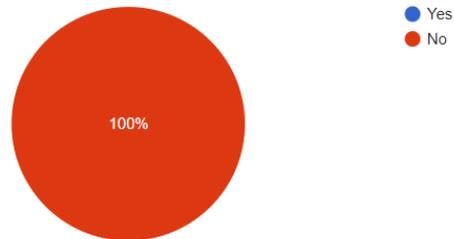

Figure 4.5 Online survey Question 5 Respondent

Does showing attendance through Web-Based help the students' parents keep track of their attendance ?

2 responses

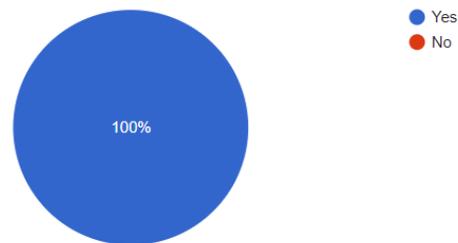

Figure 4.6 Online survey Question 6 Respondent

4.3 User Requirement

4.3.1 Internet

Internet is require in order to gain access to the website.

4.3.2 Web Browser Application

Web browser application are require in order to surf or browse internet. Without web browser, the user unable to gain access to the portal plus internet. Example of internet browser are Google Chrome, Firefox, Internet Explorer or Edge.

4.3.3 Information Technology Devices

User require to have any kind of IT devices such as computer, laptop, tablet, phone and more that support using internet browser such as Safari for IOS, Chrome, Internet Explorer or edge, Firefox and more.

4.3.4 XAMPP

XAMPP is an application that allow user to run server plus it able to read .php file format. Other than that, it came along with Apache and MySQL. The MySQL is important due to allow user to store information in database.

4.4 User Interface

4.4.1 Login Page

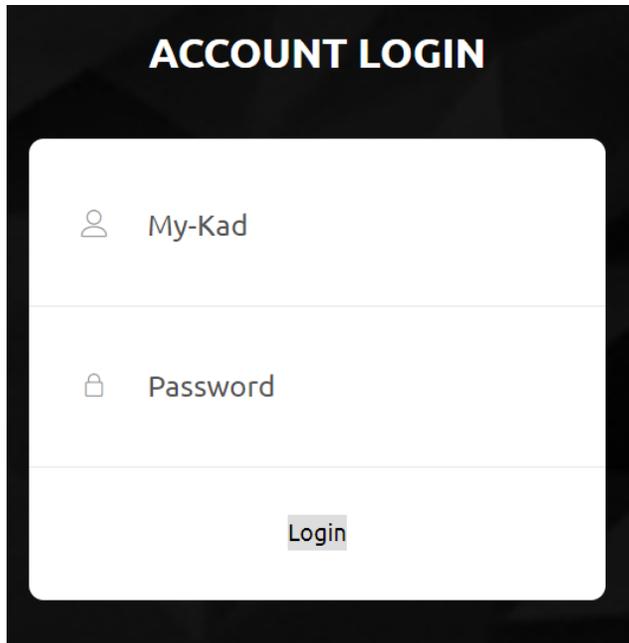

Figure 4.7 Login Page

Login Page is a page where require user to login using their MyKad and their password. Once the user the user insert their mykad and password and it was valid, the server will bring the user to the home page depend of which position are there. Such as student will go to student home page, same goes with teacher and staff.

If the user login to their home page but wish to go to other page such as teacher page by input the URL, it will transfer the user back to login page and require them to login before proceeding.

4.4.2 Staff Home Page

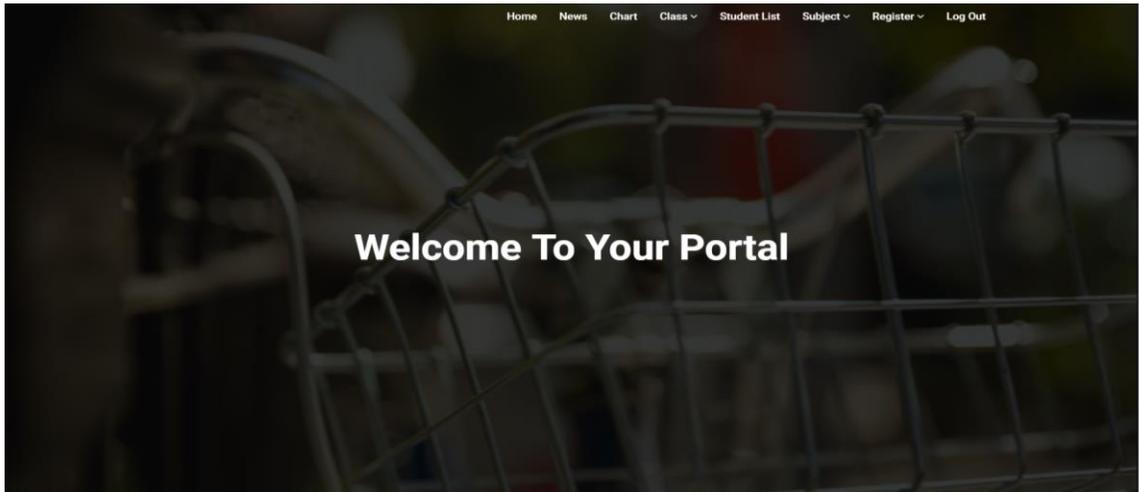

Figure 4.8 Staff Home Page

Once the user login and valid as staff, the server will transfer user to the staff home page.

4.4.3 News Page

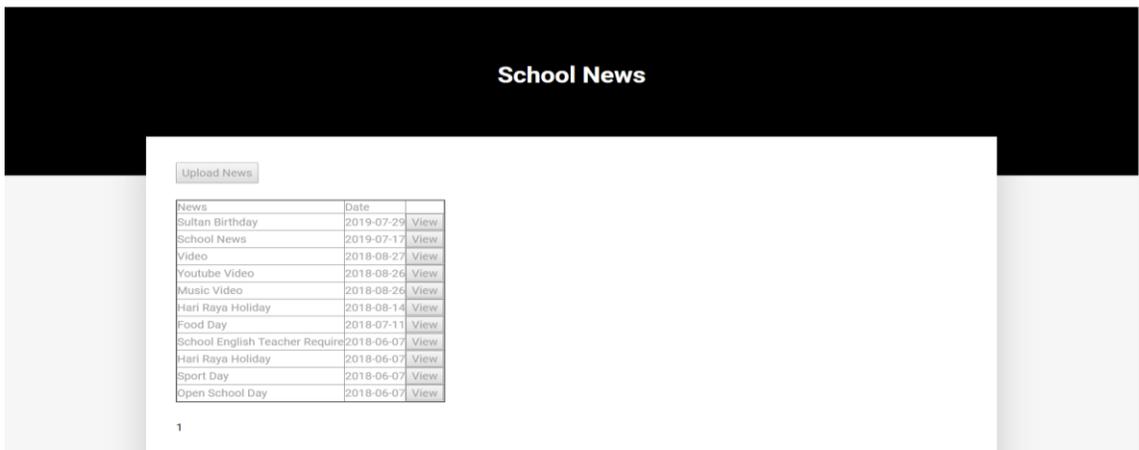

Figure 4.9 Staff News Page

The News page allow staff to view the news by clicking the view button and upload latest news by clicking upload news button.

4.4.4 News View Page

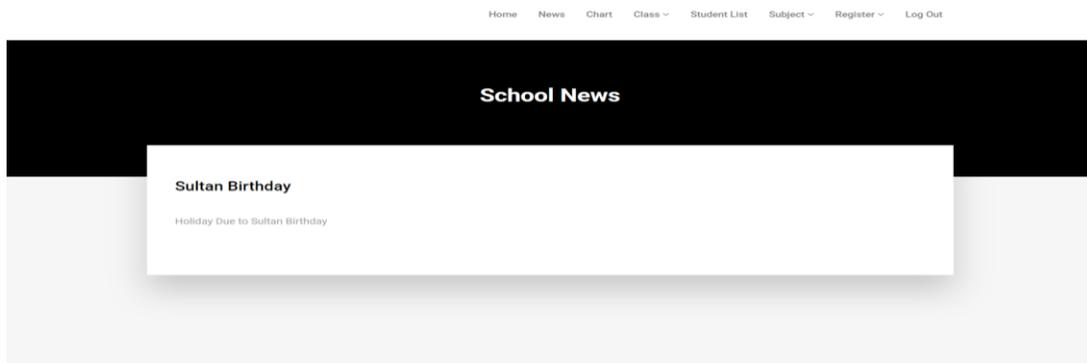

Figure 4.10 News View Page

Once the user click on view button, it will bring the user to view the chosen news. The user able to read the news or remove the news if it necessary. Only staff able to remove one of the news from the News page

4.4.5 Upload News Page

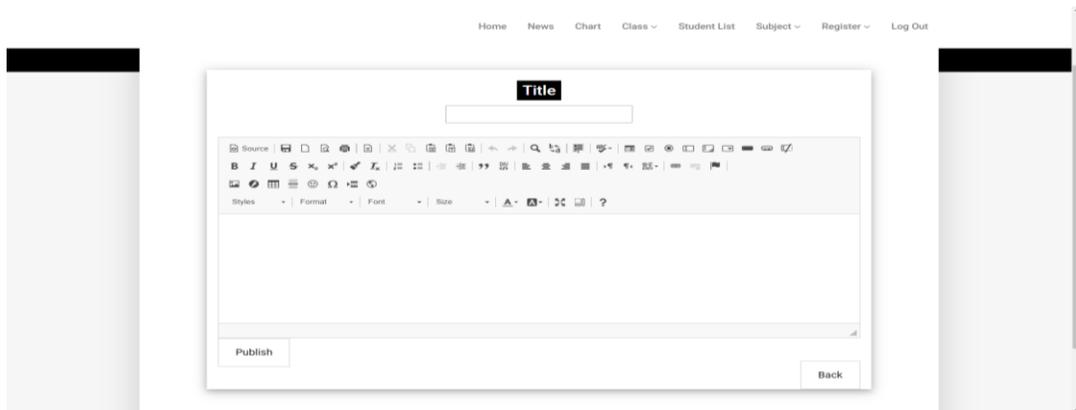

Figure 4.11 Upload News Page

After the staff click on upload news button, it will bring the user to news upload page where user able to insert latest news. Staff able to insert picture, bullet point, font style and more as they wish to design the news before upload to the server.

4.4.6 Chart Page

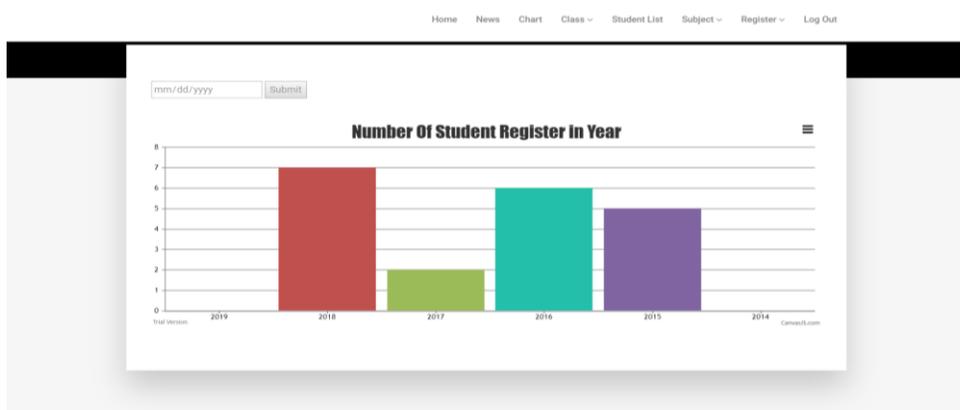

Figure 4.12 Chart Page

The chart show the user the number of student register in year. The chart will able to show 6 years with amount of student register within that year. The staff able to view other year by select the date and click on submit button.

4.4.7 Teacher Registration Page

Teacher Registration

MyKad

Name Profile Picture No file chosen

Date Of Birth/mm/dd/yyyy

Figure 4.13 Teacher Registration Page

In teacher registration page, staff able to register new teacher account into the server and allow the teacher to access the school portal after the registration is complete.

BIS (Hons) Business Information Systems

4.4.8 Staff Registration Page

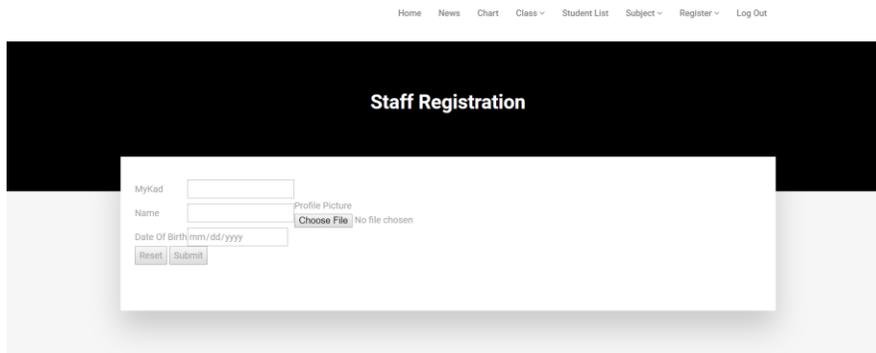

Figure 4.14 Staff Registration Page

Staff registration page allow the staff to register new staff account into the server and allow the staff to access the school portal after the registration is complete.

4.4.9 Student Registration Page

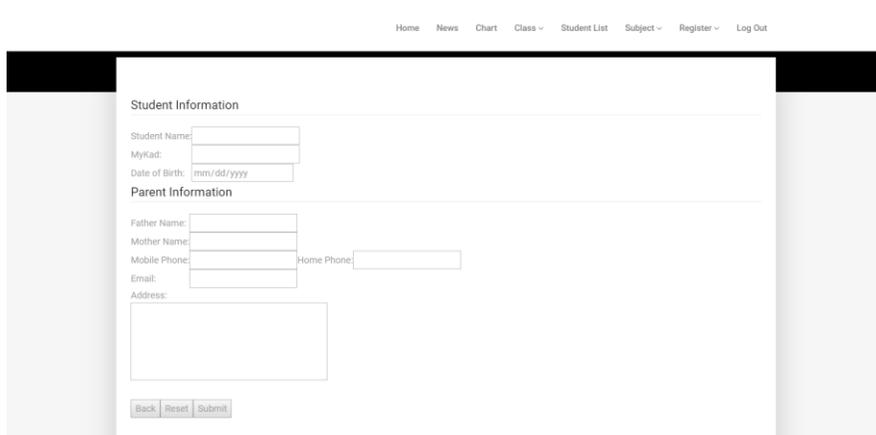

Figure 4.15 Student Registration Page

Student registration page allow the staff to register new student account into the server and allow the staff to access the school portal after the registration is complete. Staff are require to input every detail of student together with their parent or guardian details.

4.4.10 List of Class Page

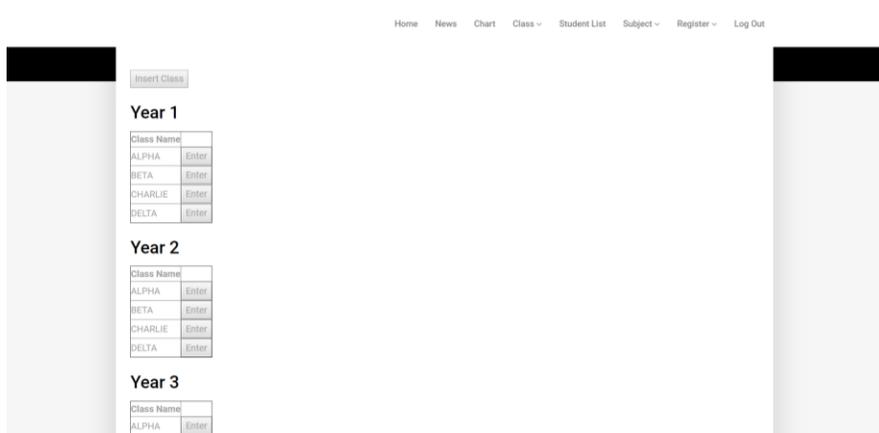

Figure 4.16 List of Class Page

The class page allow staff to insert new class into the system by clicking on insert class button or view the class that contain information of student which are assigned to be in that class plus the class teacher.

4.4.11 Add New Class Page

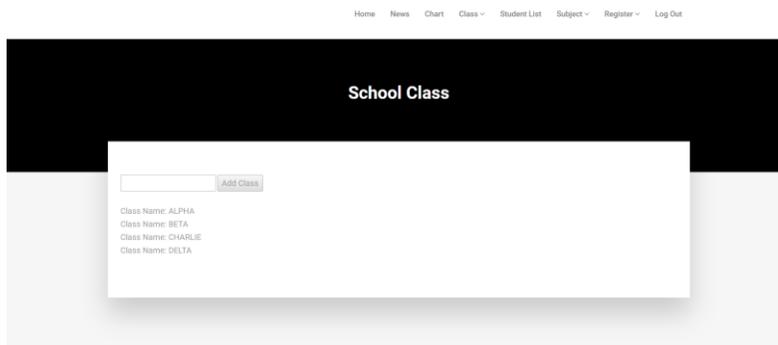

Figure 4.17 Add New Class Page

If the user click on insert class button, it will bring the user to register new class page. This page allow the staff to add new class by input the name of the class and click the add class button. After that, it will show the class name at the bottom.

4.4.12 Class View

	11	53.4691407	1.530859297	0.084650933				

Figure 5.33 Summary Output for Figure 5.32 Table

Other than that, the r-square in figure 6.2 are higher than figure 6.4. If the r-square is lower than 70% it show that the performance is medium or weak correlation. Else it has strong correlation that show every line movement explain of index movement.

By comparing the both analysis that in figure 6.2 and figure 6.4, we can see the standard error in figure 6.2 are less than figure 6.4. Standard error are calculated to know the distance of predicted line score from the actual score.

5.5.3 Score, StudyTime and Average Sessional Score

Score (y)	StudyTime (x)	Average Score First and Mid (x)

Figure 5.35 Summary Output for table Figure 5.34

R Square = 83.5%; Taken as a set, the predictor Study Time and Average Score for First and Mid account for 83.5% of the variance in Grade. But this summary output are multi-linear regression due to it has two x-variables, we have to look through adjusted R square that is 79.4%.

The p-value for Study Time is significance predictor for grade than Average Score that obtain p-value of 0.47. This is because, the average score p-value has value more than 0.05, it show that average score was not significance predictor. That is why we have to reject the average score predictor.

Chapter 6

Conclusion

6.1 Summary

This study has presented a method for improving the Web-Based Student Management System for primary school that allows easing the problematic for school staff, teacher and parents by keeping track of students during school time. This enables to improve the education system to ensure that school allow to keep track of student, teacher and staff performance and details.

- 31-40
- 41-50
- 51-60

Gender

- Male
- Female

Does your school have a Web-Based Student Management System?

- Yes
- No
- Not Sure

Does having a Web-Based Student Management System a good option for all primary schools?

- Yes
- No

BIS (Hons) Business Information Systems

Faculty of Information and Communication Technology (Kampar Campus), UTAR A-1

Which option do you prefer in the Web-Based Student Management System? Having...

- More Graphical Option (Clicking Picture or Image)
- More Word Option (Clicking Button Word)
- Both

Does publishing school news through Web-Based keep the students, parents and teachers well informed?

- Yes
- No

Does giving out timetable to students through Web-Based help keep them on track?

- Yes
- No

Does giving out examination results through Web-Based help the students' parents keep track of their grades?

- Yes
- No

Does showing attendance through Web-Based help the students' parents keep track of their attendance?

- Yes
- No

Web-Based Student Management System

Introduction

- Web-based student management system is a system that allow school staff or teacher to manage their user and student records.

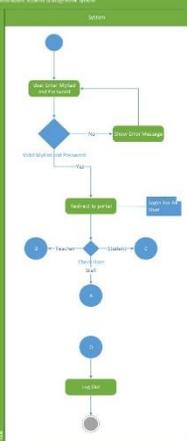

Existing System

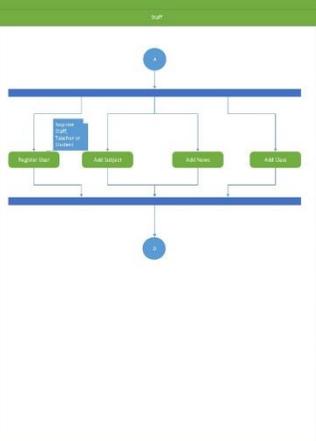

- Most of the existing system does not acquire analyze function such as using linear regression to make prediction of student grade.

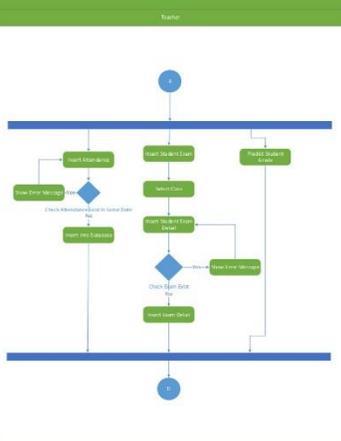

Discussion

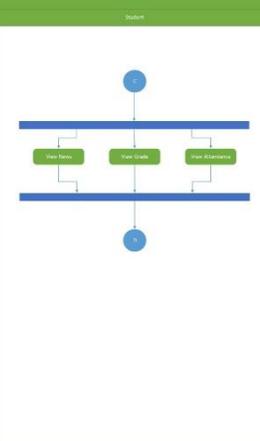

- The system allow user to store data such as student grade, student attendance, school news and more.
- The new feature of this system is the prediction function to predict Student grade by using linear regression.

Method

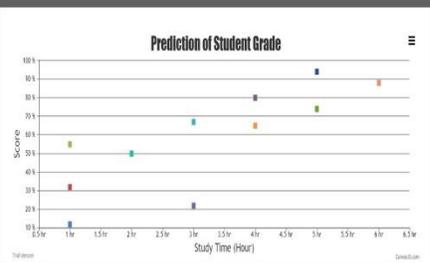

Result

StudyTime (x)	Score (y)	xy	$x - \bar{x}$	$y - \bar{y}$	$(x - \bar{x})(y - \bar{y})$	$(x - \bar{x})^2$	$(y - \bar{y})^2$
4	60	240	0.82	0.91	0.7462	0.6724	0.8281
3	22	66	-0.18	-0.66	0.1188	0.0324	0.4356
5	94	470	1.82	35.91	65.3562	3.3124	1289.3281
5	74	370	1.82	15.91	28.9562	3.3124	253.1281
2	50	100	-1.18	-8.09	9.5462	1.3924	65.4481
1	55	55	-2.18	-3.09	6.7362	4.7524	9.5481
3	67	201	-0.18	0.91	-0.1638	0.0324	0.8281
1	12	12	-2.18	-46.09	100.4762	4.7524	2124.2881
6	88	528	0.82	29.91	24.4462	0.6724	894.6081
1	22	22	-2.18	-26.09	56.8762	4.7524	680.6881
Total	35	639	2.4140	0.01	380.82	31.6364	7226.9001

Mean of StudyTime = 3.181818181818182
 Mean of Score = 58.09090909090909
 $S_x = 1.78$
 $S_y = 25.88$
 $S_{xy} \text{ (Covariance)} = 38.08$
 $R_{xy} \text{ (Correlation Coefficient)} = 0.8$
 $b_1 = 19.79$
 $b_2 = 12.04$
 $y = 19.79 + 12.04(x)$

Conclusion

- Web-Based Student Management System for primary school that help easing the problematic for school staff, teacher and parents by keeping track of students during school time and analyzing student performance.
